<b>Notices</b> .....	ix
Trademarks .....	x
<b>Preface</b> .....	xi
The team who wrote this book .....	xii
Become a published author .....	xiv
Comments welcome .....	xv
<b>Chapter 1. Introduction to the ISPF Productivity Tool</b> .....	1
1.1 Targeted audience .....	2
1.2 Definition of terms .....	2
1.3 IPT seamless integration with ISPF .....	3
1.4 Learning IPT .....	3
1.5 Increased productivity .....	3
1.6 Integration with other products .....	4
1.7 Object Linking and Embedding (OLE) .....	4
1.8 z/OS panel images .....	5
1.9 The Object List .....	5
1.10 IPT functional overview .....	6
<b>Chapter 2. Object Lists</b> .....	7
2.1 Catalog navigation .....	8
2.1.1 Exploring the system .....	8
2.2 Object List generic searches with dataset patterns .....	10
2.2.1 Hot functions or hot buttons .....	15
2.2.2 Further exploration of system datasets .....	15
2.3 Validating APF libraries .....	23
2.4 Group execution .....	28
2.4.1 Group execution by line command .....	29
2.4.2 Group execution by number reference .....	30
2.4.3 Group execution by generic reference .....	33
2.5 Permanent Object List .....	37
2.5.1 Permanent Object List for projects .....	38
2.5.2 Creating project ELUX OLIST .....	38
2.5.3 Project ELUX workflow .....	51
2.6 MEMFIND command .....	61
2.7 FINDTEXT command .....	68
2.8 AUTOMATIC Yes .....	70
2.9 AUTOMATIC No .....	72
2.10 FINDTEXT parameters .....	73
2.11 FINDTEXT ALL .....	74
2.12 FINDTEXT FIRST .....	75
2.13 FINDTEXT NEXT .....	76
2.14 FINDTEXT LAST .....	77
2.15 FINDTEXT PREV .....	77
2.16 SHOWMIG command .....	78
2.17 EMPTY Object List command .....	80
2.18 COPYALL and MOVEALL commands .....	84
2.19 BOOK and SHELF Objects .....	87

2.20 MAPPDS command .....	89
<b>Chapter 3. Member Selection Lists .....</b>	<b>91</b>
3.1 Basic MSL functions .....	95
3.2 Using IPT Member Selection List Assist .....	95
3.3 IPT Search commands .....	96
3.4 Global Find and Global Change command .....	97
3.5 Changing the Global IPT defaults for your session .....	97
3.6 The Global Edit command settings and parameters .....	98
3.7 Invoking a Find or Change command globally .....	99
3.8 Examples using the Global Find and Change commands .....	100
3.9 MSL FINDTEXT .....	103
3.10 Partitioned dataset extended .....	107
3.11 Defining PDSEs .....	108
3.12 When to use PDSs instead of PDSEs .....	108
3.13 Using ISPF concatenated libraries to manage change .....	109
3.14 MSL Point-and-Shoot fields .....	114
3.15 MSL HOTBARS .....	117
3.16 Advanced Member Selection List functions .....	119
3.16.1 IPT Support for PDS libraries: Automated compress/directory expansion ....	119
3.16.2 Using EMPTY and COMPRESS on a PDS .....	123
3.16.3 Identify members and move them to another PDS .....	124
3.17 Using the TAILOR command .....	128
3.17.1 Using the MAPPDS command to recover deleted PDS members .....	130
3.17.2 Using the expanded member name field .....	134
<b>Chapter 4. TSO Command Shell .....</b>	<b>135</b>
4.1 Validating the TSO Command Shell options in IPT .....	136
4.2 Using IQIWIZRD to customize the TSO shell command list .....	137
4.3 IPT History Commands List .....	140
4.3.1 Using the TSO Command Shell with the IPT History Command List .....	140
4.4 IPT Permanent Command List .....	141
4.4.1 Using the TSO Command Shell with the IPT Permanent Command List .....	141
4.5 TSO Command Shell list .....	142
4.5.1 Demonstration of TSO History Command List options .....	143
4.5.2 Demonstrating TSO Permanent Command List options .....	148
<b>Chapter 5. IPT Global Commands .....</b>	<b>153</b>
5.1 IPT Global commands .....	154
5.1.1 Command Shortcuts panels tour .....	154
5.2 IPT syntax definitions .....	158
5.3 Generic searches with dataset patterns .....	159
5.4 Object List commands .....	165
5.5 IPT OL, OLIS, and PLIST commands .....	167
5.6 TSO Permanent commands .....	168
5.7 IPT-related IPT shortcuts .....	171
5.8 List of IPT shortcut commands .....	174
<b>Chapter 6. Invoking IPT from ISPF Option 3.4 .....</b>	<b>177</b>
6.1 IPT Option 3.4 panel changes .....	178
6.2 Displaying a Temporary Object List .....	182
6.3 Dataset list (DS) and NON-ISPF generic searches .....	188
6.4 The MORE? indicator .....	191
6.5 Additional field panel .....	194

6.6	How to list Generation Data Groups . . . . .	196
6.7	List files by volumes . . . . .	198
6.8	Object List compared to DSLIST volume handling . . . . .	204
6.9	Populating an Object List . . . . .	205
<b>Chapter 7.</b>	<b>Enhanced cut and paste . . . . .</b>	<b>207</b>
7.1	Cutting text into a clipboard. . . . .	208
7.2	Cut using labels. . . . .	209
7.3	Cut using relative line numbers. . . . .	210
7.4	Cut using C, CC, M, or MM editor line commands . . . . .	211
7.5	Cut using NX or X operands . . . . .	212
7.6	Specifying a clipboard on the CUT command. . . . .	215
7.7	Appending text to an existing clipboard . . . . .	217
7.8	Saving the clipboard for future use . . . . .	218
7.9	Browsing and editing the clipboard data . . . . .	219
7.10	Displaying and maintaining the current clipboards . . . . .	220
7.11	Pasting text from a clipboard. . . . .	222
7.12	Paste using A or B editor line commands . . . . .	222
7.13	Paste using BEFore or AFter operands. . . . .	223
7.14	Specifying a clipboard on the PASTE command . . . . .	224
7.15	Pasting the contents of a member . . . . .	226
7.16	Pasting the directory list of a PDS. . . . .	226
7.17	Pasting the output from a TSO command. . . . .	227
7.18	Pasting a portion of the clipboard . . . . .	229
7.19	Editing the clipboard prior to copying it. . . . .	231
7.20	Pasting text as temporary MSG or NOTE lines. . . . .	232
7.21	Printing the clipboard . . . . .	235
<b>Chapter 8.</b>	<b>Using IBM File Manager for z/OS with IPT . . . . .</b>	<b>237</b>
8.1	IBM File Manager Publications . . . . .	238
8.2	Customizing IPT to invoke File Manager . . . . .	238
8.3	Invoking File Manager using LIBDEFS to allocate required datasets . . . . .	241
8.4	Using File Manager Base with IPT . . . . .	243
8.4.1	Maintaining data in hexadecimal mode using File Manager. . . . .	246
8.4.2	Using copybooks to maintain data using File Manager. . . . .	247
8.4.3	Additional features of File Manager Base . . . . .	250
8.5	Using File Manager/DB2 with IPT . . . . .	250
8.5.1	Browsing, editing, or viewing a fully qualified DB2 table in IPT. . . . .	251
8.5.2	Browsing, editing, or viewing a generic DB2 table in IPT . . . . .	252
8.5.3	Additional features of File Manager DB2 . . . . .	253
<b>Chapter 9.</b>	<b>IPT customization: First-time logon . . . . .</b>	<b>255</b>
9.1	IPT LOGON procedure . . . . .	256
9.2	IPT persistent tables . . . . .	256
9.2.1	IPT persistent tables defined with first logon. . . . .	256
9.2.2	IPT persistent tables defined by the system programmer. . . . .	258
9.2.3	IPT persistent tables defined by user customization. . . . .	258
<b>Chapter 10.</b>	<b>Customizing your ISPF keys for Point-and-Shoot. . . . .</b>	<b>261</b>
10.1	Customizing IPT with View using PF4 . . . . .	262
10.1.1	Defining PF4 for the IPT View command for SDSF . . . . .	262
10.2	IPT Point-and-Shoot to invoke an Object List . . . . .	267
10.3	Using the IPT Point-and-Shoot Commands with an MSL . . . . .	268
10.4	Invoking z/OS UNIX Object names using Point-and-Shoot . . . . .	270

10.5 Translation of symbolic information using Point-and-Shoot .....	271
<b>Chapter 11. Installing IPT V6.1 on z/OS .....</b>	<b>273</b>
11.1 Installation requirements for IPT V6.1 .....	274
11.2 Contents of the IPT product package .....	274
11.2.1 Custom-built product delivery offering tapes. ....	274
11.3 IPT installation. ....	277
11.3.1 Sample jobs .....	277
11.3.2 Allocating SMP/E global zone consolidated software inventory libraries .....	279
11.3.3 Allocating SMP/E target and distribution zone libraries .....	280
11.3.4 Allocating SMP/E temporary libraries for global zone .....	281
11.3.5 Allocating libraries for target and distribution zones .....	282
11.3.6 Defining global, target, and distribution zone options and DDDEF entries ....	285
11.3.7 Performing SMP/E RECEIVE .....	295
11.3.8 Performing SMP/E APPLY .....	295
11.3.9 Performing SMP/E ACCEPT .....	296
11.3.10 List SYSMODS for IPT .....	297
11.3.11 Installing PTF for IPT releases .....	297
11.4 Customizing the LOGON PROC to invoke IPT .....	299
11.4.1 LPA load library SIQILPA .....	300
11.4.2 CLIST library SIQICLIB .....	300
11.4.3 Table library SIQITLIB .....	300
11.4.4 IPT load library SIQILOAD .....	304
11.4.5 CLIST library SIQICLIB .....	304
11.4.6 Message library SIQIMLIB .....	304
11.4.7 Panel library SIQIPLIB .....	304
11.4.8 Skeleton library SIQISLIB .....	304
11.5 Creating RACF profile to use the customized TSO LOGON PROC for IPT .....	305
11.6 Using the new TSO LOGON procedure to invoke IPT .....	307
11.7 IPT maintenance .....	310
11.8 Ordering IPT V6.1 for clients in India .....	311
<b>Chapter 12. IPT user customization using the IPT SET command .....</b>	<b>313</b>
12.1 Invoke IPT SET menu .....	314
12.2 Using the single option to set ALL IPT defaults .....	314
12.3 Settings for Member Selection List (MSL) .....	315
12.4 Settings for Object List (OLIST) .....	316
12.5 Settings for GLOBAL FINDTEXT .....	317
12.6 Settings for PRINT .....	319
12.7 Settings for DSLIST .....	320
12.8 Setting for the Time Sharing Option Command Shell .....	321
12.9 Settings for EDIT/VIEW/BROWSE .....	322
12.10 Settings for the User Interface .....	323
12.11 Settings for diagnostics .....	324
12.12 Settings for the persistent table library .....	325
12.13 Setting for the BookManager interface .....	326
<b>Chapter 13. SCLM integration with IPT .....</b>	<b>329</b>
13.1 Customization to support SCLM .....	330
13.2 SCLM IPT interface .....	333
13.3 IPT SCLM walk-through .....	337
13.3.1 Creating a new assembler program .....	337
13.3.2 Migrating members to SCLM .....	342
13.3.3 Updating the project SCLM ARCHDEF members. ....	346

13.3.4 Building and promoting the SCLM ARCHDEF members .....	349
13.3.5 Removing the obsolete program .....	353
<b>Chapter 14. IPT double-byte character set support .....</b>	<b>357</b>
14.1 Using DBCS with the Object List .....	358
14.1.1 Configuration for DBCS support .....	358
14.1.2 Using DBCS with the Object List description .....	363
14.1.3 Using the FINDTEXT command with DBCS .....	370
14.2 Using DBCS with the Member Selection List .....	373
14.2.1 Enable MSL DBCS support .....	373
14.2.2 MSL DBCS search string support .....	375
<b>Appendix A. Customizing IBM Personal Communications .....</b>	<b>379</b>
Marking the box for cut and paste activities without the mouse .....	380
Displaying the pop-up keypad panel without a mouse .....	380
Changing PCOM to use the mouse to open and close files .....	380
Touring IPT using the mouse-enabled point-and-click function .....	382
Restoring the PCOM mouse settings .....	385

# Preface

This IBM® Redbooks® publication introduces the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS®. IPT operates as a seamlessly integrated front end to ISPF:

- ▶ IPT functionality is available from any panel without a need to modify any ISPF Primary Options Menu. All IPT functions are totally integrated. IPT can perform almost any activity within ISPF, or internally invoke the function that can perform the task.
- ▶ IPT combines separately provided ISPF utility functions and new ISPF Productivity Tool features into the Object List (OLIST) and Member Selection List (MSL). The resulting member, dataset, and object lists become powerful platforms where you can perform many tasks without navigating to other utilities.
- ▶ IPT relates objects to applications in a similar manner to the way that a PC performs Object Linking and Embedding (OLE). By extending the dataset objects that are used by ISPF to other object classes, IPT lets you specify the object to be processed and the action that is performed (such as EDIT or BROWSE). The facility that is appropriate to the object class for the action that you have requested is invoked automatically.
- ▶ IPT provides extensive search capabilities that are both rapid and intuitive. You can easily search for volumes, datasets, members, and text within members. ISPF Productivity Tool also furnishes automatic drill-down system navigation to examine volumes, datasets, and members.
- ▶ IPT provides a menu-driven facility to display and recover all of the deleted members of a partitioned dataset (PDS) library.
- ▶ IPT extends the ISPF Action Bar with options that provide access to new functionality so that you do not have to learn new commands or syntax. In addition to the ISPF point-and-shoot capabilities, IPT provides new concepts, such as hotbars (user-defined fields that execute commands), field-sensitive areas in MSLs and OLISTs, automatic recognition of a dataset name on any ISPF panel as a parameter to BROWSE, EDIT, or VIEW, or parameters within any Time Sharing Option (TSO) command.
- ▶ IPT provides integrated and enhanced IBM Software Configuration and Library Manager (SCLM) support within the standard member and dataset lists. SCLM is a source library management component of ISPF that provides change control, multiple source versions, auditing, a built-in make facility, and automatic check-in/sign-out using standard libraries (PDS and partitioned dataset extended (PDSE)). IPT includes built-in interfaces to various IBM and ISV products.

This book is intended as a supplement to existing product manuals. It starts with an overview of the main IPT concepts and facilities. It then follows with detailed chapters, each dedicated to a major IPT function, such as:

- ▶ Object lists
- ▶ Member selection lists
- ▶ Enhanced point-and-shoot
- ▶ EDIT CUT and PASTE
- ▶ IPT with IBM File Manager
- ▶ IPT with IBM SCLM
- ▶ TSO Shell
- ▶ IPT installation and customization
- ▶ An example of implementing an IPT user-defined object list

An appendix explores selected topics.

Practical scenarios, accompanied by detailed screen captures and coding examples, demonstrate how to take advantage of the IPT enhanced functionality in every case.

## The team who wrote this book

This book was produced by a team of specialists from around the world working remotely from Australia, China, India, Sweden, and the United States through the International Technical Support Organization.

**Michael Rotter** is a Senior Software Engineer at IBM Tivoli® in New Jersey, US. Mike is currently serving as the Chief Architect/Developer/Level-3 Support for the ISPF Productivity Tool product. Mike joined IBM in July 2005 during the acquisition (by IBM) of his former company ISOGON. Mike has over 30 years of experience with system-level software development in large system environments with MVS, OS/390®, and z/OS. Prior to joining IBM, Mike held software development leadership positions at ISOGON, STERLING Software, AT&T Federal Systems, E.F. Hutton, J.P. Morgan Bank, Informatics, and more.

**Tiju Ambalathingal** is a Senior System Analyst at IBM GBS Global Delivery in Bangalore, India. Tiju is currently the Technical Solution Manager for Enterprise Application Modernization associated with AIS. His current responsibilities include providing the technical solution outline, approach, effort estimations and architect solutions to modernize mainframe applications for enterprises around the globe. Tiju joined IBM in December 2002 as an Application Programmer. Tiju has eight years of experience in mainframe application development, maintenance, and migration. In this tenure, he has held the role of Technical Project Leader.

**Steve Coalbran** is an accredited Senior IT Specialist with IBM Global Business Services® in Stockholm, Sweden. Steve has well over 30 years of application development and design-to-end experience within IBM. From 1978, he worked in the UK, transferring to Sweden in 1999. Steve specializes in the development of innovative solutions and tools that increase the productivity and efficiency of developers and production systems. He has worked primarily with MVS from OS/360 through z/OS and, to a lesser extent, with CMS and OS/2, AS/400®, DOS, and Windows®. In the past years, his work in Sweden related to the implementation of customized IBM product line solutions, replacing and improving on existing software. Steve especially focused on tailoring ISPF and REXX in products within the AD Tool set, working closely with both Software Sales and ISPF development.

**Howard Givner** is an Advisory Software Engineer at IBM Tivoli and at present is a member of the zSecure Suite development team. Howard Givner has been involved with software design and development for fifty years, including several years developing Spiffy, the precursor of IPT, taking it past the Y2K hurdle. For over thirty years, he served on the faculty of the Brooklyn College Mathematics and Computer Science departments, where he taught calculus, algebra, logic, computer programming, computer architecture, and data structures to undergraduates. During his college tenure, he authored articles that were published in professional journals, including the proceedings of a major computer users group; he provided programs which he created and which were included in a contributed program library; and he pioneered the use of mainframe computers for such college administrative applications as final exam scheduling, graduation requirements checking, admissions applicant selection, and online registration. He also invented and copyrighted a generalized report writing language.

**Gregory Green** is a Senior IT Specialist and Project Lead with IBM Corporate Headquarters group, Enterprise On Demand, living and working in the USA. Greg has 25 years of broad industry experience in Application Design, Development, and Implementation. Current projects include IT project lead for development and implementation of processes for direct return to the repair vendor of used parts from IBM service engagements and projects related to IBM Warehouse Management System (WMS). Other experience includes a range of IT-related and business-related projects and large volume mainframe-based online customer-facing systems utilizing IBM operating systems from MVS and OS/390 to z/OS, CICS®, and DB2®, and to a lesser extent, IMS™. Greg has written about database conversion methodology from Oracle® to DB2. Greg holds a BS from Pennsylvania State University and an MBA from Mount St. Mary's University.

**Dhanya Nair** is a Senior Software Engineer at IBM GBS Global Delivery in Bangalore, India. She is currently performing the role of Technical team leader in the Single Backlog, S & D Customer Fulfillment project. Her current responsibilities include application analysis, design, planning, estimation, development, testing, implementation, and maintenance of application software under the mainframe environment. In addition, she is responsible for imparting domain knowledge and guidance and mentoring the team members to complete the tasks assigned to them and ensure on time delivery with zero defects. Dhanya joined IBM in January 2004 as an Application Programmer. She is an IBM Certified Database Associate and completed a Six Sigma project in a Single Backlog, S & D Customer Fulfillment project as a Green Belt. She has five years of experience in mainframe application development and maintenance.

**Chaitra Narayanaswamy** is a System Engineer at IBM GBS Global Delivery in Bangalore, India. She is currently working for the S&D Customer Fulfillment project under IBM Global Account. She joined IBM in November 2006 as an Application Programmer. Her current responsibilities include planning, estimation, analysis, design, development, testing, integration, implementation, and maintenance of applications under the mainframe environment. She has primarily worked with MVS from OS/390 through z/OS and also VM and has over two years of experience in ISPF and other z/OS tools. She is an IBM Certified DB2 Database Associate. In addition, she has contributed to a Six Sigma project for productivity improvement.

**James Rice** is a Certified IT Specialist, residing near Tampa, Florida. Jim is a z/OS Problem Determination Tools Technical Sales Specialist. Jim joined IBM in 1984 as an Application Developer. He has over 30 years of experience with IBM mainframe computers. He has held job positions as an Application Developer, DB2 Database Administrator, Test Manager, Administrator of test z/OS environments, and Technical Sales Specialist for the IBM Problem Determination Tools area.

**Ren Xiao Yang** is a Senior IT Specialist at IBM Software Group in Beijing, China. He has nine years of IBM work experience, supporting CICS, MQ and related tools, and PD tools across the platform. He works for multiple large banks, performing business requirement analysis, system architecture design, application design and development, debug and performance tuning, system implementation and troubleshooting, maintenance, and technical support. Before joining IBM, he worked for seven years as an Application Programmer and System Engineer.

**Walter (Zack) Zakorchemny** is a Certified Senior IT Specialist with IBM Americas Software Group. Walter has over 25 years of experience with z/OS in many areas, including operations, systems programming, and technical sales. Prior to joining IBM in 1980, Walter worked as an IT Specialist for the Banking and Aerospace industries. During the past four years, Walter has been the Technical Sales Team Lead for the ISPF Productivity Tool and has developed sales material, created training workshops, and provided input for enhancements for the IPT product. Walter is based in Sea Isle City, New Jersey, US.

Thanks to the following people for their contributions to this project:

Eric Chabert, IBM, Software Sales IT Specialist, Montpellier, France

Amit Kr Joshi, IBM, System Administrator: Mainframe, Bangalore, India

Joe DeCarlo, Manager, Special Projects, International Technical Support Organization, San Jose, CA

## Become a published author

Join us for a two- to six-week residency program. Help write a book dealing with specific products or solutions, while getting hands-on experience with leading-edge technologies. You will have the opportunity to team with IBM technical professionals, Business Partners, and Clients.

Your efforts will help increase product acceptance and customer satisfaction. As a bonus, you will develop a network of contacts in IBM development labs, and increase your productivity and marketability.

Find out more about the residency program, browse the residency index, and apply online at:

# Introduction to the ISPF Productivity Tool

In this chapter, we provide a general description of the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS. We discuss the features, functions, and facilities that ISPF Productivity Tool provides to enhance ISPF.

## 1.1 Targeted audience

This book addresses the questions of IPT users. However, anyone, who uses ISPF, benefits from IPT. Frequent users benefit the most.

This book also provides information for the product installation team.

## 1.2 Definition of terms

This document references several acronyms:

- ▶ **ISPF Productivity Tool (IPT)**

This book focuses on the ISPF Productivity Tool. The ISPF Productivity Tool previously was known as SPIFFY.

- ▶ **Object List (OLIST)**

An *Object List* is a series of references to your data stores. Using an object list, you can organize all the data stores that are required for your project. An object list can contain sequential, Virtual Storage Access Method (VSAM), partitioned dataset (PDS), or PC files, DB2 tables, imbedded OLISTS, IBM Software Configuration and Library Manager (SCLM) hierarchies, Panvalet or Librarian files, UNIX® System Service files, data definition (DD) name references, and user-defined processes.

- ▶ **Partitioned dataset (PDS)**

PDS is a dataset organization for holding collections of related records in groups called “members”.

- ▶ **Partitioned dataset extended (PDSE)**

The PDSE is identical to the PDS organization, but it has additional sharing and space management capabilities.

- ▶ **Member Selection List (MSL)**

A *Member Selection List* is similar to the ISPF member list that is presented when opening a PDS or PDSE. However, an IPT Member Selection List provides enhancements, which perform complex functions, minimizing the keystrokes and navigation that are required to perform a task.

- ▶ **IBM Software Configuration and Library Manager (SCLM)**

SCLM is a z/OS Software Configuration Management product that manages changes to your application data, performs auditing and versioning, and controls the movement of application data from one set of libraries to the next.

- ▶ **User Defined Objects (UDO)**

User Defined Objects provide the functionality of your choice. They are installed, defined, and tailored to handle the user objects. You can specify a User Defined Object as an Object List entry with a leading greater than (>) symbol. For example, the following Object List command invokes the MYOBJECT User Defined Object:

```
>MYOBJECT
```

## 1.3 IPT seamless integration with ISPF

The ISPF Productivity Tool (IPT) works as an extension of ISPF. You do not have to initiate a separate product within ISPF to use the ISPF Productivity Tool. ISPF and IPT work together as one product. For example, you can use OLIST commands to locate files, use MSL commands to locate the correct PDS member, edit the member using ISPF, and use ISPF and IPT commands during the edit session.

## 1.4 Learning IPT

You do not have to spend hours learning IPT to use it. ISPF functions are still available after the IPT product installation. As you learn more about IPT, you can begin to become more productive using the new shortcuts and tools available.

IPT provides many features that make it easy to learn:

- ▶ The **IPT?** command presents a list of IPT shortcuts.
- ▶ Action bars are available to guide you to the correct command.
- ▶ When using an Object List, the ASSIST (or A) command summarizes each Object List primary and line command available

You can also display the command syntax and examples by entering ASSIST *olistcommand* (or A *olistcommand*). For example, A FINDTEXT provides the details of the FINDTEXT command.

- ▶ The Member Selection List ASSIST command summarizes each MSL primary and line command syntax and examples of each MSL command.

You can also display the command syntax and examples by entering ASSIST *mslcommand* (or A *mslcommand*). For example, A WHERE provides the details of the WHERE command.

The ISPF Productivity Tool invocation uses an ISPF logon procedure that is designed for IPT. You can turn off IPT for the duration of your ISPF session, by entering IPTOFF;=X without leaving ISPF. To turn it back on, you can enter IPTON;=X.

## 1.5 Increased productivity

A development organization's time is valuable. Programmers often write shortcuts, using CLIST or REXX programs, to help with repetitive tasks, and share these tools with their peers. IPT standardizes the shortcuts and tools that you need to be productive with ISPF. Think of the time that IPT will save everyone.

For example, have you ever seen the “No space in directory” message when adding members to a PDS? Think of the number of panels and keystrokes that ISPF requires when allocating a new PDS, copying the members, and renaming the dataset. With IPT, you will see a confirmation window to expand the PDS directory. Press Enter, and the PDS directory is compressed, without leaving the edit session of your PDS member.

IPT uses hotbars, field-sensitive areas in the Object List, Member Selection Lists, and 47 shortcut commands to minimize the time that is required to get the job done.

Using a single command invoked from an Object List, you can search multiple files for a member name, data within a member, or data in sequential files from an Object List. With IPT, you can make Global changes to PDS or PDSe members.

These features are a few of the time-saving tips that you will find in this book. IPT is full of shortcuts, making more efficient use of your time when working on a z/OS mainframe.

## 1.6 Integration with other products

The ISPF Productivity Tool enhances the standard Time Sharing Option (TSO)/ISPF to improve productivity and performance. IPT integrates seamlessly into the ISPF product. IPT extends the functions provided by ISPF to other dataset objects, including Virtual Storage Access Method (VSAM) files, SCLM libraries, Librarian or Panvalet libraries, z/OS UNIX System Services, PC Files, and DB2 tables, as well as other object classes.

Using the IPT customization wizard, you can define the CLIST that is used by the various products. Then, you will be able to access the following files directly from an Object List:

- ▶ VSAM Files:
  - IBM File Manager for z/OS
  - Other third-party products
- ▶ Software Configuration Management Systems:
  - IBM Software Configuration and Library Manager
  - Other third-party products
- ▶ DB2 tables:
  - IBM File Manager/DB2 for z/OS (with IPT Version 5.10)
  - Other third-party products

## 1.7 Object Linking and Embedding (OLE)

With ISPF, you might need to navigate using many panels and products to search for data, browse data, or edit data, when the data is stored on DB2 tables, VSAM files, Panvalet or Librarian files, UNIX System Services files, or PC Files. IPT relates objects to applications in a similar manner to the way that a PC performs Object Linking and Embedding (OLE).

OLE is the process by which a specified object (such as a VSAM file) is registered to a method (for example, File Manager) that performs a task that the user requests. Usually, it is sufficient to select the object in order to take the appropriate action. IPT will resolve the class of object, the desired action, and determine what program or product will perform the requested function.

## 1.8 z/OS panel images

This document depicts many panel images of IPT. The images are captured in a “reverse image” color scheme, to minimize the black background of standard 3270 images. The panels will look similar to what you will see on your mainframe. However, you might notice other differences, such as:

- ▶ Most panels do not show the Program Function (PF) keys. The PF keys are the same as the standard ISPF PF keys. They can be turned on or off by the following commands:
  - PFSHOW ON
  - PFSHOW OFF
- ▶ Circles, arrows, and callout boxes, which are not part of the IPT product, are shown on several of the panel images.

## 1.9 The Object List

IPT introduces a new concept – an Object List. An object list is a data store reference, which is used to organize your work into a single folder. With an Object List, you can organize all the required files into a single project folder, an OLIST.

Consider the following example. You are developing and testing an application. You created an Object List with 10 objects, as shown in Table 1-1.

Table 1-1 *MYPROJ Object List*

Object	Type of object	Object name
1	SCLM Hierarchy	<USBAPP.DEV1.SOURCE
2	JCL	'MYID.JCLLIB'
3	PROC	'MYID.PROCLIB'
4	DB2 Table	USBAPP.CUSTORDER
5	SEQ File	'MYID.CUST.ORDER'
6	SEQ File	'MYID.CUST.ORDER.REPORT'
7	VSAM File	'MYID.CUST.MASTER.FILE'
8	USS File	)U/MYID/Project Documentation
9	Imbedded Olist	'USBAPP*PROJECT'
10	Control Data	'MYID.CONTROL'

The Object List in Table 1-1 represents all the files that you need to modify an application for a customer change request. Think of this Object List as a “Project File” for the customer change request. Using the SCLM Hierarchy, you can easily reference all the levels in the SCLM tree, and all SCLM library types. Files containing the test JCL, PROC, and Control members are contained in the OLIST. Project documentation can reside in a UNIX System Services file. The application also uses VSAM, and DB2 files, which you can easily reference. With this OLIST, you can access any of your project files by simply selecting the file that you need. The Object Linking and Embedding process will invoke the correct utility to reference the file. An Object List is persistent. Therefore, changes that you make to the Object List are not lost when you log off the TSO session.

## 1.10 IPT functional overview

IPT offers the following functions:

- ▶ Point-and-Shoot: Provides extensive Point-and-Shoot capabilities on datasets and member names, column headings, hotbars, and action fields.
- ▶ TSO Command Shell enhancements: Create permanent TSO command lists and execute TSO commands from any ISPF panel.
- ▶ Enhanced clipboards: Temporary and permanent numbered or named clipboards.
- ▶ Automatic PDS compression: Invokes compress command when a PDS is full.
- ▶ Automatic PDS directory expansion: Invokes EXPDIR command when a PDS directory is full.
- ▶ SCLM, Librarian, and Panvalet support: Edit and browse files from your ISPF panels. There is no need to navigate to Library Management products.
- ▶ Enhanced dataset patterns: Dataset patterns do not require a period. For example, SYS\*S is a valid dataset name pattern request.
- ▶ Extensive search capabilities: Locate volumes, datasets, members, and text.
- ▶ Automatic integrated access: Edit and browse VSAM files, DB2 tables, hierarchical file system (HFS) files, PC files, catalog levels, and other objects. There is no need to navigate to other products.
- ▶ Extremely fast results: Many IPT functions invoke a single utility to process a request with multiple files.

## Object Lists

The Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS introduces us to a new concept – an Object List, as shown in Figure 2-1. An Object List is a data store reference, which is used to organize your work into a single folder. With an Object List, you can organize all of the required files into a single project folder, which is called an *OLIST*.

Figure 2-1 Working with the Object List so that now all of the user's project files are together

ISPF Productivity Tool (IPT) is really useful in helping you to explore the system using the system catalog. Imagine that you are a new user to a system or investigating an unfamiliar area. The catalog is the obvious starting point. In this section, we examine the concepts of Catalog navigation and concentrate on several of the Group execution techniques.

## 2.1 Catalog navigation

In this section, we explore the new system to which we were assigned. We start by reviewing our environment, which includes all files that are currently allocated to our session.

### 2.1.1 Exploring the system

Let us start by creating a temporary OLIST, which we can do using the OLDDNAME command, which has a shortcut of OLDD. You can supply a particular DDname, for example, OLDD SYSHELP, to see all of the Time Sharing Option (TSO) Help libraries. However, we omit the parameter to see all of the DDnames that are allocated, as shown in Figure 2-2.

```
Menu Utilities Compilers Options Status Help

```

Figure 2-5 Issuing an OLDD command without a DDname parameter

There are many libraries allocated at this installation, so we stopped scrolling here. Your list will differ.

Seeing all of the libraries that are allocated, we must focus on particular subsets, one at a time. We can start by looking at the first library in the STEPLIB concatenation, as shown in Figure 2-3 on page 9.

## 2.2 Object List generic searches with dataset patterns

Generic pattern searching in IPT is more inclusive than ISPF. The patterns follow a common and well defined system, similar to ISPF:

- ▶ Use the asterisk (\*) to search for any number of characters.
- ▶ Use the percent symbol (%) to search for any single character.
- ▶ Note that the IPT wildcard % includes dots. Standard ISPF does not include dots.
- ▶ Because the IPT system is so much less restrictive, it is preferable to force this type of search by ensuring that the pattern does not conform to the more restrictive ISPF standard. Table 2-1 on page 11 shows examples.

Table 2-1 Patterns

Generic pattern	Datasets found by intuitive search
SYS%**CLIB -or- SYS%.****CLIB	'SYS030.EPS.PROCLIB' 'SYS1.DGTCLIB' 'SYS1.MACLIB' 'SYS1.PROCLIB' 'SYS1.PROCLIB.ZT00PLEX.MOP' 'SYS1.SISTCLIB' 'SYS1.SPROCLIB' 'SYS1.SVCLIB' 'SYS2.PROCLIB' 'SYS2.PROCLIB.FLEXES' 'SYS2.PROCLIB.FO' 'SYS2.PROCLIB.ZT00PLEX.MOP'
SYS1**LIB*.%%%	'SYS1.PARMLIB.ZT00PLEX.MOP' 'SYS1.PROCLIB.ZT00PLEX.MOP'

**For more information:** Refer to 5.3, “Generic searches with dataset patterns” on page 159.

To focus on only the datasets that match, we create a temporary OLIST using IMS\* as a pattern. This command displays all datasets that begin with IMS, as shown in Figure 2-6.

```

```

Figure 2-13 Toggling from the Class column to the Volume column display

The result is that the Class column is toggled to display the dataset Volume column. Program function key or PF6 achieves the same result, as do the commands: VOLUME or SHOWVOL. To change back, toggle back by placing the cursor on the Class column and pressing Enter, or issue the commands: CLASS or SHOWCLAS.

### 2.2.2 Further exploration of system datasets

Let us look at another way to explore the system allocations. We can use the `OL/` command, as shown in Figure 2-14.

```

Menu Utilities Compilers Options Status Help
                                     z/OS Primary Option Menu
Option ==> OL/
-----
0 Settings      Terminal and user parameters      User ID . : SE16661
1 View          Display source data or listings   Time. . . : 10:44
2 Edit          Create or change source data      Terminal. : 3278
3 Utilities     Perform utility functions         Screen. . : 1

```

Figure 2-14 Using the OL/ command to display the system files

The OL/ command displays a pop-up panel, as shown in Figure 2-15 on page 16, where you can choose several alternative ways to populate the generated OLIST.

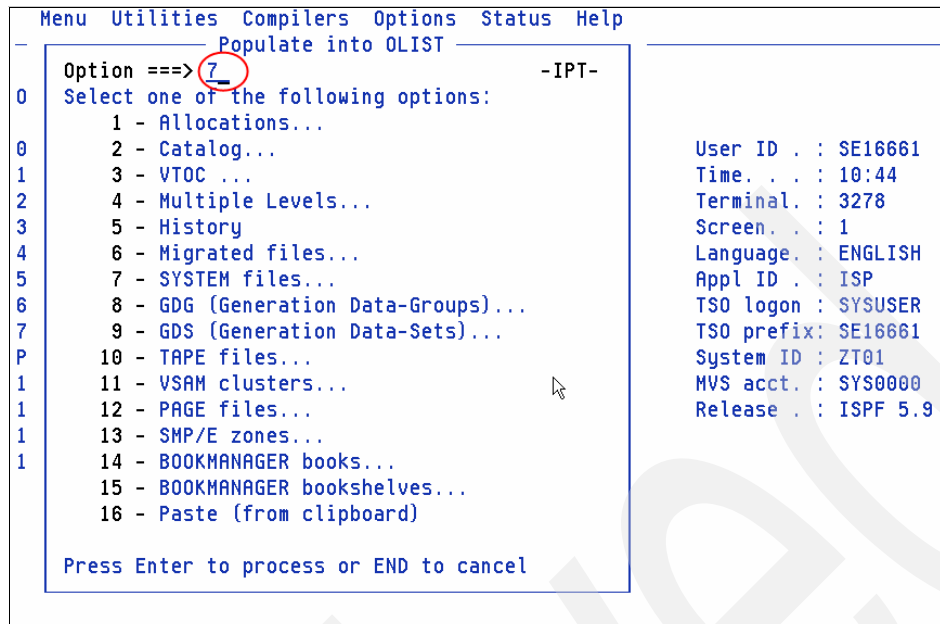

Figure 2-15 Pop-up selection panel to select Object List population criteria

At the top of Figure 2-15, we see the option that we selected before when we discussed OLDD, 1 – Allocations.

Let us investigate option 7 – SYSTEM files. Either enter a 7 in the Option field, or use the cursor to point-and-shoot<sup>1</sup> at the line System libraries by category. The panel shown in Figure 2-16 is displayed. Select option **5 All of the above**.

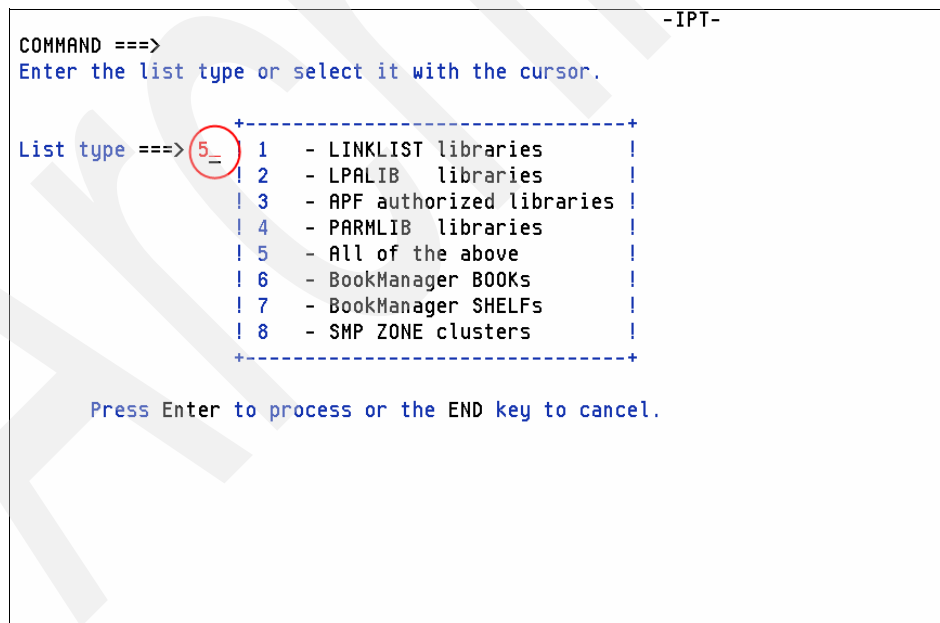

Figure 2-16 Select the type of list to display

Figure 2-17 on page 17 shows the results that we obtained.

<sup>1</sup> You might also want to refer to Appendix A, “Customizing IBM Personal Communications” on page 379.

```

Figure 2-17 Selected all of LINKLIST, LPALIB, APF, and PARMLIB libraries

The list is long. Each category is separated by a comment line that describes the libraries that follow, which we can show using the FILTER command, as shown in Figure 2-18.

**Note:** Because the codepage used in Figure 2-17 is Swedish, the Euro symbol displays at the beginning of the comment line instead of the exclamation mark (!), which is typical. This symbol might vary if you use a different codepage.

          16 'LPALST.CICSVT.V1R2.SVIDLPA'

```

Figure 2-21 Result of using FLIP on the Object List shows all but the category separator comment lines

Now, we can analyze what is contained on each volume. We can use the SORT command, for example, to see which libraries are on the Z00RES system pack (Figure 2-22).

**Note:** Remember that if at any time within an OLIST (or an MSL), you are unsure of the syntax of a command or of which commands are available, you can use the ASSIST command, for example, A SORT for the SORT command.

First ensure that the Volume column is populated by use of the FILLVOL command in Figure 2-22...

## 2.3 Validating APF libraries

Validating APF libraries is an especially useful attribute of IPT. In development shops, the APF libraries are often a problem. They are frequently out-of-date, because changes are made and the APF list is not maintained. Often deletions are overlooked. Going back to the O/ list, select option 7 (see Figure 2-15 on page 23), for System files, and then from this panel, select option 3 to generate an OLIST for the APF authorized libraries, as shown in Figure 2-30.

```

-IPT-
COMMAND ==>
Enter the list type or select it with the cursor.

List type ==> 3
+-----+
| 1 - LINKLIST libraries |
| 2 - LPALIB libraries  |
| 3 - APF authorized libraries |
| 4 - PARMLIB libraries |
| 5 - All of the above  |
| 6 - BookManager BOOKS |
| 7 - BookManager SHELFs |
| 8 - SMP ZONE clusters  |
+-----+

Press Enter to process or the END key to cancel.

```

Figure 2-30 OLIST for APF authorized libraries

Figure 2-31 displays the current APF library objects list.

```

Figure 2-53 Requesting to view a group of datasets

In Figure 2-53, we inadvertently selected 9-10 instead of 10-11, and the first of these datasets is a migrated dataset (and it is the Index of a VSAM dataset). IPT knows that the dataset is migrated and that we do not want the standard TSO response, which is to WAIT or press Attention. Therefore, IPT provides certain alternative options to use, as shown in Figure 2-54 on page 33.

```

-IPT- OLIST ----- HSM MIGRATED DATA SET RECALL PROMPT PANEL -----
OPTION ==> (X)

You have requested the following HSM migrated data set:
IMS.CELDCUSX.D01.INDEX

Select one of the following options (option 2 is the default):

1  INFORMATION      - Display migrated data set information.
2  RECALL and WAIT  - Recall the data set. Wait until data set is recalled.
3  RECALL offline   - Recall the data set. Do not wait for it to be recalled.
X  EXIT             - Do not recall the data set

Make your selection and press ENTER. (The END key will exit)

```

Figure 2-54 Migrated dataset recall prompt

We chose option X to ignore our previous action. We then proceed to VIEW the next dataset, as shown in Figure 2-55.

```

File Display Library Settings Menu Utilities Test Help Exit

```

Figure 2-55 Viewing a COPYLIB library's directory

We can now go back to correctly view dataset 11 from Figure 2-53 on page 32 independently; however, we will skip this step.

### 2.4.3 Group execution by generic reference

We can act on a whole range of datasets by issuing a generic reference.

The \* DELETE command, for instance, might sound risky if you have ever issued a TSO DELETE TEST.\* command. However, IPT makes certain that you really want to delete a dataset. IPT gives you the option to cancel one or all actions. In Figure 2-56, we have added a FILTER for IMS.APPC. Note the \*FILTER\* flag. Let us try to DELETE all the datasets at one time.

```

File Edit Find Display Populate Settings Menu Util Test Help Exit

## 2.5 Permanent Object List

In this section, we discuss creating a permanent Object List.

Figure 2-64 Permanent Object List

Creating a temporary view of data objects is useful, but sometimes you might want to save a certain set of objects that you can use frequently in a particular operation. The set of objects can be something as simple as the set of libraries that you use the most or the set of databases that you monitor or maintain.

## 2.5.1 Permanent Object List for projects

To help explain the permanent OLIST, in this section, we describe a real-life scenario (project). This project is not large, which helps to keep things understandable. This project does not involve all of the IPT features.

This scenario involves one activity that frequently occurs for a particular development center programmer, who was called on to assist senior auditors in the Asset Management department in the complicated cross-matching of data. This request became a periodic on-demand task for this professional.

The asset manager has several massive Excel® spreadsheets that have various details, such as assets, contacts, orders, shipments, deliveries, and so on that they update and manipulate, attempting reconciliations. The senior auditors were unable to manipulate extremely large volumes by using LOOKUPs VLOOKUPs. So, they call upon the assistance of the development center programmer.

The development center programmer can, of course, resolve the problem in several ways. DB2 tables might be a solution, if they were consistent and precise in their use of the spreadsheets, but they are not. This particular programmer is adept in REXX and has a large processor available. The programmer saves and uploads the spreadsheets as comma-separated value (CSV) files and processes them using compiled REXX programs.

Although the file formats, content, and requirements change each time, the activity is similar each time that it is requested. The spreadsheets to be matched (two, three, sometimes up to six) are sent to the programmer, who uploads them to the host. A new REXX exec is then tailored based on previous examples, compiled, and tested, and any required modifications are applied. The results from the match are downloaded to the PC and then e-mailed to the auditors.

The following list summarizes the tasks that are completed on the host. Files are sent and received using Lotus® Notes® attachments:

- ▶ Upload CSV files to host.
- ▶ Modify and run JCL to accept new input and output file names.
- ▶ Modify the compile JCL to compile the new exec.
- ▶ Create a new REXX exec, and compile the REXX exec to a load module.
- ▶ Run the REXX program.
- ▶ Review the output of the CSV file.
- ▶ Download the output CSV to the PC.

Note: As a general suggestion for permanent OLISTs, most entries need to be patterns, which automatically handle any catalog changes to those datasets. You might typically have only a couple of stable datasets, such as JCL or PROC libraries, as explicit dataset names within any OLIST. The other datasets are various patterns. Even if only a single name matches that pattern, there is a good chance that new names matching those patterns might be added later.

## 2.5.2 Creating project ELUX OLIST

Before we look at the final OLIST, which has been around for a while, let us look at how the first ELUX project OLIST was created from the beginning. Creating the first ELUX project OLIST does not map exactly to the order in the previous bulleted list, because there are a few additional stages in the initial setup.

Set the defaults that you want for OLISTs, in general, with the ISET command, as shown in Figure 2-65.

```

Menu  Utilities  Compilers  Options  Status  Help

z/OS Primary Option Menu

Option ==> ISET

0  Settings      Terminal and user parameters      User ID . . : SE16661
1  View          Display source data or listings    Time. . . . : 06:29
2  Edit          Create or change source data      Terminal. . : 3278
3  Utilities     Perform utility functions        Screen. . . : 1

```

Figure 2-65 Setting OLIST defaults using ISET

Enter option 0 to select your defaults, as shown in Figure 2-66.

```

-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==> 0
Select options by number, name, with cursor selection, or with line commands:
Web link: http://www.ibm.com/software/awdtools/ispfproductivitytool
IBMIP is running under ISPF version 5.9

- A - ALL          - Select all the below displayed options
- M - MSL          - Member Selection List options
- 0 - OLIST        - Object list options
- G - GLOBAL       - Global edit and Findtext options
- P - PRINT        - Print options
- D - DSLIST       - DSLIST options
- T - TSO          - TSO shell options
- E - EDIT         - Edit, Browse and View options
- I - INTERFACE    - Specify user interface options
- N - DIAGNOSE     - Diagnose ISPF errors
- L - LIBRARY      - Persistent table library options
- B - BOOKMGR      - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit

```

Figure 2-66 Setting OLIST defaults using ISET option O

Figure 2-67 on page 40 is displayed where you can set your Object List Options.

```

-IPT- -----OLIST - Object List Options-----
COMMAND ==>

Default command (when selecting an item) ==> B (B=Browse, E=Edit, V=View)
Show VOLSER of cataloged data-sets ==> N (Y=Yes, N=No)
Check edit recovery when the list opens ==> N (Y=Yes, N=No)
Provide a field for TSO command parms ==> Y (Y=Yes, N=No)
Display mode (right column shows) ==> C (C=Class, V=Volume)
Default cursor position ==> M (M=Main command, L=Line cmd)
Include member names in dataset history ==> N (Y=Yes, N=No)
Double-Byte-Character-Set (DBCS) support ==> Y (Y=Yes, N=No)
  If DBCS supported, use case-sensitive search strings ==> N

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 2-67 Setting OLIST defaults on the Object List Options panel

In Figure 2-67, we chose N for the option “Show VOLSER of cataloged data-sets” and C for the option “Display mode (right column shows)”, because, typically, using uncataloged datasets is rare for most users. The actual location of the data is unimportant, because most environments use system-managed storage.

Choose your own preferences for the default actions. You can always come back at any time and amend them.

Return directly to the main menu by pressing End.

Create an empty permanent OLIST as shown in Figure 2-68.

Menu Utilities Compilers Options Status Help			
z/OS Primary Option Menu			
Option ==>	OL ELUX		
0	Settings	Terminal and user parameters	User ID . . : SE16661
1	View	Display source data or listings	Time. . . : 06:29
2	Edit	Create or change source data	Terminal. . : 3278
3	Utilities	Perform utility functions	Screen. . . : 1

Figure 2-68 Creating a permanent OLIST

This option creates an empty OLIST named ELUX, as shown in Figure 2-69 on page 41.

```

-IPT----- Object List -----
COMMAND ==>

Specify the DSNNAME pattern you would like to populate into the OLIST:

DSNAME ==> ELUX

Optionally specify a VOLUME pattern:

VOLUME ==>          (To filter data sets catalogued to this volume pattern)

+-----+
! Examples:
!   DSNNAME ==> SE16661*PAY%%*DATA      DSNNAME ==> SE16661*COBOL
!   VOLUME ==>                          VOLUME ==> PROD*
+-----+

Press ENTER to proceed or END key to cancel the catalog search command.

IQIP883  "ELUX" not in catalog

```

Figure 2-69 ELUX Object List

Press End to continue.

First, for the ELUX project, we add the FTP control members. We need to upload the files from the PC to the host and back. We do not have the workstation connections set up here, because the programmers are all familiar with, and prefer to use, FTP for this task. The file names and password in the FTP commands might change, but the basic process is the same. After you set up the FTP command, the FTP command does not change for this particular project, which we show in Figure 2-70.

```

-----
(-E) FTP%LD 1 'SE16661.ELUX.PCTL' PDSE
----- END OF LIST -----

```

Figure 2-82 Return to the OLIST after editing

Next, we add entries for the CSV files that are referenced here, and the file that we decided will be the output file. The easiest way to add entries for these files, because they do not yet exist on the system, is to use the UPDATE command (UPD for short), as shown in Figure 2-83 on page 46. The UPDATE command is a great feature of OLISTs that gives you complete control over the order of the entries and the appearance of the list. Enter UPD.

```

File Edit Find Display Populate Settings Menu Util Test Help Exit
-----
-IPT- OLIST (B) ----- Asset Management ----- Row 1 to 1 of 1
Command ==> UPD SCROLL ==> CSR
Hotbar: FLIP CLRVOL FILLVOL REFRESH UTIL CUT SET UPDATE

Finally, we plan to use a REXX exec, which runs under UNIX (OMVS) to perform the download and to send the file directly to the contact in asset management. It is still being written, but it is running late and we want to accommodate it in advance.

We have this section that contains the exec in the list so that we can browse the status of it, as shown in Figure 2-89.

Press End to save the program when completed, as seen in Figure 2-109.

```

-E CONASS 6 'SE16661.ELUX.EXEC' PDSE

```

Figure 2-109 Saving after editing the REXX code for the file match program

Compile the REXX exec to a load module. Submit the compile+linkedit job, either by typing the TSO command SUB (Figure 2-110) or by typing option J in the command field on line 7, as shown in Figure 2-111.

```

(SUB) REXXCL 7 'SE16661.ELUX.JCL' PDSE

```

Figure 2-110 Typing the SUB command to submit the job

```

J REXXCL 7 'SE16661.ELUX.JCL' PDSE

```

Figure 2-111 Submitting the job to compile and link-edit the REXX code

We take the second option. Press Enter to SUBMIT the job. A line message is displayed “IKJ56259I JOB SE16661C(JOB01234) SUBMITTED”. Then, another message appears in Figure 2-112 on page 57:

“14.38.19 JOB01234 AHASP165 SE16661C ENDED AT MOPZT00 – JCL ERROR CN(INTERNAL)”

Figure 2-112 JCL error

So, fix the problem. Remember renaming those system libraries? And, rerun the job until you see this message:

“14.43.22 JOB01234 ÅHASP165 SE16661C ENDED AT MOPZT00 MAXCC=0 CN(INTERNAL)”

Run the REXX program.

We can check the status of the job by using the custom user defined object (UDO<sup>4</sup>, OUT) on line 10. However, we invoke the TSO command SDSF with the status parameter ST (on line 11). Type S against line 11, and press Enter, as shown in Figure 2-113.

<div style="border: 1px solid black; border-radius: 50%; width: 20px; height: 20px; display: flex; align-items: center; justify-content: center; margin-bottom: 5px;">S</div> <div style="border-bottom: 1px solid black; width: 100%;"></div>	<pre> 11 +SDSF ST SE16661C                                CMD 12 @----- FTP transfer in OMVS ----- 13 )/u/se16661/ftpdnld.rexx                        OE ----- END OF LIST ----- </pre>
--	---

Figure 2-113 SDSF status command

This action invokes the TSO command (notice the + prefix) SDSF with the two parameters (ST SE16661C), which requests a status list of all jobs with jobname SE16661C, as shown in Figure 2-114.

SDSF STATUS DISPLAY ALL CLASSES										LINE 1-1 (1)

        ----- END OF LIST -----
```

Figure 2-122 Error in trying to look at the HFS file holding the REXX exec

This action results in an error, which is shown in Figure 2-123. Perhaps we got an error because we set this job up in IPT V5.9 when OMVS support was introduced.

```
IKJ56479I COMMAND OBROWSE NOT FOUND OR REXX IDENTIFIER IS MISSING+
IKJ56479I SUPPLY '/* REXX */' AS THE FIRST RECORD TO EXECUTE AS A REXX EXEC OR,
FOR AN EXPLICIT EXEC, SUPPLY THE EXEC KEYWORD ON THE EXEC COMMAND
*** _
```

Figure 2-123 Error in trying to look at the HFS file holding the REXX exec

**Note:** In IPT V6.1, a ZUNIX object name must start with “/”, “~”, or “.”. There is no longer a need to add a closing parenthesis “)” in front of the object name to indicate the type of object. The same object in z/OS V1.8 and earlier will be treated as an Open Edition (OE) object and thus processed via CLIST IQI\$OE. Under z/OS V1.9 and later, the object will be processed by native ISPF UNIX support.

So, that is our problem. The closing parenthesis character, ), is redundant and erroneous, so we try again.

This attempt is shown in Figure 2-124.

```
S_      12 €----- FTP transfer in OMVS -----
        13 /u/se16661/ftpdnld.rexx                      OE
        ----- END OF LIST -----
```

Figure 2-124 Attempting to look at the HFS file holding the REXX exec again

The developers have not progressed too far, as we can see in Figure 2-125.

```

Figure 2-125 Browsing the HFS file holding the REXX exec to see the stage of development

We clearly see that the promised code has not yet been delivered; it is only a stub.

## 2.6 MEMFIND command

Figure 2-126 MEMFIND command

Using the MEMFIND command within an OLIST, you can search multiple partitioned datasets (PDS) or partitioned datasets extended (PDSE) for a specific member name or even search for members that follow a particular pattern.

The MEMFIND or MF command locates the first, next, or all libraries in the OLIST that contain the specified member.

Figure 2-127 on page 62 shows a temporary OLIST, OL CICSTS\* issuing the MEMFIND (MF) command, which is entered here without a text string specified.

We issue a MEMFIND command in Figure 2-126.

```

```

Figure 2-127 MEMFIND command: Issued without parameters

On the pop-up panel that displays, which is shown in Figure 2-128 on page 63, you enter the search argument, and you can also limit the search scope:

- ▶ A member name or member name mask. The MEMFIND (alias MF or FINDMEM) command for Version 6.1 supports unrestricted member name patterns (not only by common prefix):
  - ASMTDLI
  - ASM\*
  - ASM%DL\*
  - \*MTDL\*

All of these commands must include the first member name in their results:

- ▶ The scope that each command's search differs slightly:
  - 1NEXT searches the list for the next library containing the specified member (default).
  - 2FIRST searches the list in order and stops as soon as the library is found that contains the member.
  - 3ALL searches all libraries for the specified member.
- ▶ You must specify whether to exclude failures: Y/N.

```

Figure 2-137 Result of the FLIP command

To remove the text box displayed, simply press Enter.

When you complete your work in the OLIST, you can end or exit the panel using PF3.

You can use the REFRESH (REF) command to refresh the current OLIST from its original parameters.

These various forms of RESET(RES) are also useful commands:

<b>RESET</b>	Clears the command column.
<b>RESET M</b>	Clears the member column.
<b>RESET EXCLUDE</b>	Shows all of the libraries in the OLIST.
<b>RESET ALL</b>	Resets all of the fields and returns the OLIST to its original state.

You can issue the ASSIST RESET command to see the full range of options.

## 2.7 FINDTEXT command

Using FINDTEXT (or FT) on an OLIST, you can search up to 99,999 Sequential, PDS, and PDSE datasets for a text string and return the results with incredible speed<sup>5</sup>.

**Note:** DB2 tables, VSAM files, UNIX System Services files, embedded Object Lists, and dynamic Object Lists are bypassed when you use the FINDTEXT command.

The OLIST FINDTEXT command uses the same syntax as the MSL FINDTEXT command. However, for the OLIST variant, the search stops at the first member in that object (sequential dataset or member of a library) unless the ALL parameter is specified. Refer to the 2.7, "FINDTEXT command" on page 68. The ALL parameter overrides any global settings.

<sup>5</sup> You can customize the maximum number of objects in a temporary OLIST up to 99,999 by using IQIWIZRD.

If the GLOBAL AUTOMATIC control is set to N, the search also stops at the first member in the object for the entire list of datasets. If the GLOBAL AUTOMATIC control is set to Y, the search continues for all valid objects within the list.

If the GLOBAL EXCLUDE control is set to Y, all objects that did not match the text string on the search are omitted from the display. If the GLOBAL EXCLUDE control is set to N, the whole list is shown.

So, if you want to search for multiple members within the libraries, set the GLOBAL AUTOMATIC control to Y. Another option is, after you have found every object in which the text is found, to use the MSL GLOBAL FIND or FINDTEXT commands within each object. Refer to Chapter 3, “Member Selection Lists” on page 91” for more details.

If the search string contains blanks or special characters, enclose the text-string in quotation marks, for example, FT ‘this & that’. If the text-string contains single quotation marks, enclose the text-string in double quotation marks. Or, if the text-string contains double quotation marks, enclose the text-string in single quotation marks.

The command is not case sensitive, for example, the command FIND TRACE returns the lines with the word: “TRACE”, “trace”, “TrAcE”, or any combination of upper and lower case. If a case-sensitive search is required, use the C‘xxxx’ formats. If a hexadecimal search is required, use the X‘xxxx’ formats. To see all of the options at one time, you can simply issue the FINDTEXT (FT) command without an argument.

We start by setting our OLIST GLOBAL AUTOMATIC control to Y and run a scenario using a search for a simple text string ‘XYZ’.

Then, we switch the GLOBAL AUTOMATIC control to N and run the same scenario, or a portion of it, as a comparison.

We will keep the GLOBAL EXCLUDE control set to Y to reduce confusion.

Figure 2-138 shows issuing the SET GLOBAL command from the command line of a temporary OLIST for ‘DDS1113.IPT\*’.

----- END OF LIST -----

```

Figure 2-148 FINDTEXT OLIST command: FT 'XYZ' results

## 2.10 FINDTEXT parameters

FINDTEXT is most often used as plain FINDTEXT where, after an initial invocation, RFIND can be used to chain through the objects. However, you can use the FINDTEXT command with the following parameters: ALL / FIRST / NEXT / PREV / LAST to modify the normal

sequence of searching. Because you are searching for objects, which can be mixed sequential and partitioned formats, the search sequence is similar to, but not identical to, searching within a single sequential file.

## 2.11 FINDTEXT ALL

In Figure 2-149, we see a search for ALL of the occurrences of a string.

```

File Edit Find Display Populate Settings Menu Util Test Help Exit
-----

                   3 'DDS1113.IPT2.TEXT'                               PDSE
                   4 'DDS1113.IPT3.TEXT'                               PDSE
                   5 'DDS1113.ISPF.IPITBLIB'                           PDSE
                   ----- END OF LIST -----

```

Figure 2-154 Finding the first occurrence of a string: The result of the command

The first occurrence (in the first member) is located.

## 2.13 FINDTEXT NEXT

You can use the FINDTEXT NEXT command to find the next occurrence of a string, perhaps after you have been searching backwards (see 2.15, “FINDTEXT PREV” on page 77), as in Figure 2-155. Here, we assume that, as a starting point, we had issued a PREV search, which “wrapped” from the first to the last occurrence<sup>7</sup>. Then, we repeated the PREV search, taking us to row number 3. Now, issuing a NEXT search will reverse the direction of search.

```

File Edit Find Display Populate Settings Menu Util Test Help Exit
-----

## 2.16 SHOWMIG command

This new feature provides for an easier way of working for many people who work in a storage-managed environment. The SHOWMIG command allows you to automatically split migrated datasets. The command can be issued in one of three ways. When you select how you want to issue the command, your selection is saved in your user PROFILE:

- ▶ SHOWMIG ON sets SHOWMIG status to ON.
- ▶ SHOWMIG OFF sets SHOWMIG status to OFF.
- ▶ SHOWMIG toggles between ON and OFF.

When SHOWMIG status is OFF<sup>8</sup>, and we issue an OLIST command that will display objects, including migrated objects, the migrated objects are excluded. We issue a command OL SYS\*.TEMP in Figure 2-158.

```

Menu Utilities Compilers Options Status Help
-----
ISPF Primary Option Menu
Option ===> OL SYS*.TEMP
-----
0 Settings Terminal and user parameters User ID . : DDS1113
1 View Display source data or listings Time. . : 01:05
2 Edit Create or change source data Terminal. : 3278
3 Utilities Perform utility functions Screen. . : 1

```

Figure 2-161 OLIST for SYS\*.TEMP

<sup>8</sup> [SHOWMIG] OFF here means “hide migrated”, ON means “show migrated”.

The OLIST displays as in Figure 2-162 where all datasets, wherever they are located, are shown.

## 2.17 EMPTY Object List command

Figure 2-168 on page 81 reflects the EMPTY Object List command.

Figure 2-167 Concept of the EMPTY Object List command

The EMPTY command empties a library of all members. Use this command if you need to empty a library prior to copying or moving members from another library. Figure 2-168 shows issuing the OL DDS1113.IPT\* command.

```

Menu  Utilities  Compilers  Options  Status  Help
-----
ISPFI Primary Option Menu
Option ==> OL DDS1113.IPT*
0 Settings      Terminal and user parameters      User ID . . : DDS1113

```

Figure 2-168 EMPTY a library: Create an OLIST to demonstrate

We see the results of these EMPTY commands in Figure 2-169 on page 82 to Figure 2-172 on page 83. First, we have to confirm that we really meant to empty the library. We change the N shown here to Y (if we want to empty the library).

```

File Edit Find Display Populate Settings Menu Util Test Help Exit
-
- -IPT-          EMPTY Dataset Confirmation

               4 'DDS1113.IPT3.TEXT'                                         DMPU38
-----
                                END OF LIST

```

Figure 2-179 COPYALL: Status is updated after the command

We repeat the same process to populate the IPT3 library. Populating the IPTSEQ sequential dataset does not require a COPYALL. We use the EDIT command to edit IPTSEQ and perform a standard ISPF EDIT COPY of DDS1113.IPT.TEXT(ALL).

MOVEALL works in exactly the same way as COPYALL, except that the source library is deleted afterward.

## 2.19 BOOK and SHELF Objects

It is easy to access an IPT manual or product documentation<sup>9</sup>. As long as you know the high-level name of the manual, which is typically BOOK. For example, to get the IPT manuals, which, at the time of writing this book, were the V5.10 manuals, type the OLSH BOOK.IQI\* command, where IQI is the IBM prefix for IPT. See Figure 2-180.

Menu Utilities Compilers Options Status Help

OLIST enhancements	
●	New object classes recognized: BOOK (BookManager®), SHELF (BookManager), ZONE (SMP/E).
●	IBM BookManager invoked when selecting BOOK and SHELF objects.
●	VSAM object handler invoked when selecting a VSAM PATH or ALTINDEX file.
●	FINDTEXT command now fully supports the GLOBAL AUTO and EXCLUDE settings. All displayed data sets may be searched in one shot (like MSL GLOBAL).
●	New command EMPTY, empties (with a confirmation) partitioned and sequential data sets.

Figure 2-185 IPT User's Guide: What's new in release 5.10

## 2.20 MAPPDS command

We briefly mention the MAPPDS command here. We fully explain it in the refer to this command, which is fully covered in Chapter 3, “Member Selection Lists” on page 91. The MAPPDS command is useful for recovering members that have been deleted from a PDS

(note, not a PDSE, which manages its own content differently). You can, as always, issue the ASSIST command for assistance. In Figure 2-186, we issue the MAPPDPS command against our IPT OLIST<sup>10</sup>.

```

Figure 2-187 MAPPDPS: Directory map

There are a number of commands available to use at this point, including the most useful:

- ▶ B (Browse)
- ▶ E (Edit)
- ▶ V (View)
- ▶ R (Restore) You can “undelete” any mistakenly deleted members.

<sup>10</sup> We changed the OLIST to be more generic, replacing DDS1113.IPT.TEXT, DDS1113.IPT2.TEXT, DDS1113.IPT3.TEXT, and DDS1113.IPTSEQ.TEXT with a single entry, DDS1113.IPT\*.

## Member Selection Lists

In this chapter, we explore Member Selection Lists (MSL) and the functions that can be performed when working with a list of members. This chapter is divided into sections for what we consider Basic and Advanced commands. We have included the more frequently used functions in the Basic MSL section and the more infrequently used, but extremely useful, functions in the Advanced MSL section. Table 3-1 on page 92 and Figure 3-2 on page 96 provide a listing of the functions included in each section.

Table 3-1 Basic MSL commands and functions

Main command	Line command	Command function
ASSIST	N/A	The ASSIST command controls the display of MSL assist panels on the Member Selection List panel.
N/A	B	The B command invokes the BROWSE process on the specified members. The B command can be used as a line command or a main command.
Copy	C	The Copy command copies the specified members to the same or a different library. Copy can be used as a main command. C can be used as a line command or a main command.
COPYALL	N/A	The COPYALL command invokes IEBCOPY to copy all members of a partitioned dataset (PDS) library concatenation to another dataset.
Delete	D	The Delete command deletes one or more members specified from the library containing them. Delete can be used as a main command. D can be used as a line command or a main command.
DSName	N/A	The DSName command is used to change the Member Selection List to another library, to refresh the current display, or to invoke the current process (BROWSE, EDIT, or VIEW) on a specified dataset.
Edit	E	The E command invokes the EDIT process on the named member.
EXCLude	X	The EXCLude command is used to eliminate members from the Member Selection List display (or to unexclude all excluded members). The line command equivalent of EXCLude is X.
FILter	N/A	The FILter command is used to selectively tailor the display of members in the Member Selection List (or to remove all filtering).
Find	N/A	The Find command locates a particular member in the Member Selection List. If the member is in the hidden list, it is displayed in the MSL.
FINDTEXT	N/A	The FINDTEXT (or FT) command locates the next member in the displayed list that contains a specified text string.
FLIP	N/A	The FLIP command toggles between visible and invisible (excluded and filtered-out) lines.
Global	N/A	The Global command is used to initiate global editing of the members in the displayed member list.
Locate	N/A	The Locate command positions the cursor in the member selection list panel at the first member matching the specified character string.
REFRESH	N/A	The REFRESH command refreshes the Member Selection List display from the current directory.
Rename	N/A	The Rename command renames a member in the current Member Selection List.
S	S	The S line command selects an item and invokes the default process for that item. (The default process depends on the type of object, how MSL was invoked, and the setting on the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS Options panel for MSL.) S can be used as a line command or, following a member, as a main command.
SELECT	N/A	The SELECT command processes members under the default process (BROWSE, EDIT, or VIEW) or another line command specified.
SORT	N/A	The SORT command is used to put the Member Selection List into a specified order.
SUBmit	N/A	The SUBmit command submits a member as a batch job.
TYPE	N/A	The TYPE command changes the library (or libraries) being processed to one (or ones) with the same name (or names) as currently displayed.
View	V	The V command invokes the view process on the one or more members specified.

Table 3-2 Advanced MSL commands and functions

Main command	Line command	Command function
ALIAS	N/A	The ALIAS command adds a new name to an existing member.
COMPRESS	N/A	The COMPRESS command is used to compress one or more of the libraries in the current concatenation hierarchy. It is to be distinguished from the EDIT and VIEW subcommand COMPRESS, which is used to compress the library currently in EDIT or VIEW.
CONFIRM	N/A	The CONFIRM command activates or deactivates the member-delete confirmation panel.
DEFAULT	N/A	The DEFAULT command is used to change the default process invoked by the SELECT and S commands during the current MSL session.
EMPTY	N/A	The EMPTY command is used to empty one or more of the libraries in the current concatenation hierarchy.
EXIT	N/A	The EXIT command is used to return directly to the panel from which MSL was invoked.
EXPDIR	N/A	The EXPDIR command is used to expand the directory of one of the libraries in the current concatenation hierarchy, thereby allowing it to contain more members. It is to be distinguished from the EDIT and VIEW subcommand EXPDIR, which is used to compress the library currently in EDIT or VIEW.
N/A	H	The H command indicates in which libraries of the concatenation one or more members occur. The synonym for H is WHERE.
INFO	N/A	The INFO command is used to display information about the libraries in the current concatenation sequence of the MSL.
ISPEXEC		The ISPEXEC command invokes ISPEXEC on the one or more members specified.
	J	The J command submits a member as a batch job. The synonym for J is SUBMIT.
	K	The K command is used for library management functions, under IBM Software Configuration and Library Manager (SCLM).
LIB	N/A	The LIB command allows you to switch to other libraries by changing the middle-level qualifier (GROUP) of the currently displayed libraries. In a hierarchy, the LIB command adds or removes a library to the concatenation.
LMAP	N/A	The LMAP command is used to display a load module mapping.
MAPPDS		The MAPPDS command displays a map of all existing and deleted members of a PDS library. Members may be Browsed, Viewed, or Restored.
Move (PDS only)		The Move (PDS only) command moves one or more specified members to another dataset.
MOVEALL		The MOVEALL command invokes IEBCOPY to move all members of a PDS library concatenation to another dataset.
P	P	The P (Main command) command prints one or more specified members to a printer or to the ISPF LIST dataset, as specified on the SET panel. The P (Line command) command copies the one or more specified members.
PROJECT	N/A	The PROJECT command changes the library (or libraries) being processed to one (or ones) with the same name (or names) as currently displayed, except that the high-level qualifier is as specified in the command.
RELEASE	N/A	The RELEASE command is used to close or delete the current print group. The RELEASE command is applicable only if the PRINT processing mode is set to GROUP.
RESET	N/A	The RESET command is used to reset some or all of the tailoring of the current member list. It can be used to unexclude all excluded members, remove all filters, clear the RENAME field, and restore the default sorting (ascending by member name).
SAVE		The SAVE command writes the currently displayed Member Selection List to a user-specified dataset, a printer, or the ISPF LIST dataset.

SCLMCMD		The SCLMCMD command performs the specified SCLM function on the members (active only if SCLM support is active for the user).
SCLMPARM		The SCLMPARM command displays the SCLM parameters active for the current library (active only if SCLM support is active for the user).
SSI		The SSI command displays SSI information for the specified members.
STATS		The STATS command creates, removes, or allows the user to change statistics of members.
TAG		The TAG command places a character string in the RENAME field of the member list of members that match the specified name or pattern.
TAILOR		The TAILOR command executes the MSL command or commands defined as your tailoring macro. The TAILOR command can also be used to display and change the current definition.
TOTALS		The TOTALS command displays statistics' totals for the non-excluded, non-filtered members.
TSO	T	The T command invokes the specified Time Sharing Option (TSO) command or CLIST on the one or more members that are specified.
UNFilter		The UNFilter command removes the most recently applied filter, or all filters.
USAGE		The USAGE command lists library members currently in use under ISPF from the displayed list, including the user IDs of the TSO users accessing them.
W		The W command displays a preview panel in the Member Selection List for the named member.
WHERE		WHERE is a synonym of the H command.
X		Use the X command to eliminate members from the Member Selection List display (or to unexclude all excluded members).
Z		The Z command creates, removes, or changes statistics of members.
=		The = command repeats the preceding line command.
%		The % command executes the CLIST/REXX EXEC that is specified on the RENAME column.

## 3.1 Basic MSL functions

A Member Selection List allows you to perform these tasks:

- ▶ Identify specific members for subsequent actions by using commands, such as:
  - FILTER to select members using various field headings, including statistics with wildcard characters
  - GLOBAL Find and Change to locate or change data in several or all members of a PDS or partition dataset extended (PDSE)
  - EXCLUDE to exclude specific members
  - FLIP to switch between excluded members and included members
  - Assist to obtain information about Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS commands, such as the SORT command, on various field headings, including statistics
- ▶ Combine multiple utility functions into a single common Member list.
- ▶ Find text using either of these methods:
  - Global search capabilities
  - Locate or filter member lists prior to performing a search
- ▶ Perform global edits.
- ▶ Invoke immediate access to other libraries using library switching.
- ▶ Preview data.
- ▶ Issue multiple commands on multiple members using extended patterns.

## 3.2 Using IPT Member Selection List Assist

IPT provides an *Assist* feature when working with objects from a Member Selection List (MSL). The Assist feature is a convenient reminder of the functions that are available in the MSL. In this section, we show you how to use the MSL Assist.

To activate the Assist feature, type an A on the command line, as shown in Figure 3-1.

```

```

Figure 3-1 Activating the Assist panel

## 3.4 Global Find and Global Change command

The Global command initiates global editing of the members in the displayed member list. You can locate (FIND) members by context and perform Global Find operations. Using the Global Find command, you can locate members, filter the Member List for only members containing specific text, and display found text along with the member names. You can also change members by context and perform global change operations.

## 3.5 Changing the Global IPT defaults for your session

You can display or modify any of your current Global settings in your IPT profile by issuing the ISET command. Select the Global settings by selecting the GLOBAL option by typing an S line command, as shown in Figure 3-3.

```
-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==>
Select options by number, name, with cursor selection, or with line commands:
Web link: http://www.ibm.com/software/awdtools/ispfproductivitytool
IBMIPT is running under ISPF version 5.9

- A - ALL           - Select all the below displayed options
- M - MSL           - Member Selection List options
- O - OLIST         - Object list options
- S - GLOBAL        - Global edit and Findtext options
- P - PRINT         - Print options
- D - DSLIST        - DSLIST options
- T - TSO           - TSO shell options
- E - EDIT          - Edit, Browse and View options
- I - INTERFACE     - Specify user interface options
- N - DIAGNOSE      - Diagnose ISPF errors
- L - LIBRARY       - Persistent table library options
- B - BOOKMGR       - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit
```

Figure 3-3 Results of the ISET command

Figure 3-4 shows the results of selecting the Global option.

```
-IPT- -----GLOBAL/FINDTEXT commands options-----
COMMAND ==>

MSL GLOBAL Control
STOP AFTER ==> 9999 (Number of items to process successfully)
PROMPT AFTER ==> 200 (Number of items to process before prompt is issued)
START COLUMN ==> 1 (Quick FIND starting column in target data record)
END COLUMN ==> 99999 (Quick FIND end column in target data record)
Specify Y (Yes) or N (No) for the following options:
AUTOMATIC ==> Y (Process without editing successful items?)
LINK ==> Y (Process each command only if previous command succeeds?)
PRINT ==> N (Generate listing of each member changed and saved?)
EXCLUDE ==> N (Exclude failing items from selection list?)

OLIST FINDTEXT/MEMFIND Control
STOP AFTER ==> 5000 (Number of items to process successfully)
PROMPT AFTER ==> 5000 (Number of items to process before prompt is issued)
START COLUMN ==> 1 (Starting column in target data record)
END COLUMN ==> 99999 (End column in target data record)
Specify Y (Yes) or N (No) for the following options:
AUTOMATIC ==> Y (Search without stopping at successful items?)
EXCLUDE ==> N (Exclude failing items from object list?)

Press ENTER for options menu, END to exit, CANCEL for installation defaults.
```

Figure 3-4 Results of choosing option G from the Setting IBMIPT Defaults panel

## 3.6 The Global Edit command settings and parameters

In this section, we review the parameters and settings that are available in the Global dialog (Figure 3-4 on page 97):

- ▶ **STOP AFTER**

This option allows you to limit the number of members to be processed. There will be times when you might need to process only a few members, for example, if you are looking for a member that contains the program IEBCOPY. Instead of searching your entire MSL, you can set this number to a low value that stops the process after it finds the first occurrence or the first 10 occurrences. The search argument can appear in a member multiple times, but it is only counted as found one time per member. Setting this number to a high number ensures that the entire MSL is processed without any additional keystrokes from you.

- ▶ **PROMPT AFTER**

This option lets you decide how many members will be processed before you are prompted again and must press Enter again. The default is 50, and the maximum number is 9999. Setting these numbers to the maximum allows your Find or Change to run uninterrupted.

- ▶ **START COLUMN**

This option initiates the find of the specified text in a specific column and is similar in function to the ISPF start-column function of the Find command.

- ▶ **END COLUMN**

This option ends the search for the specified string at a specific column and is similar in function to the ISPF end-column function of the Find command.

- ▶ **AUTOMATIC====>Y/N (Process without editing successful members?)**

A setting of Y allows IPT to provide a list of the members where the target of the Find or Change command was found. The STOP AFTER and PROMPT AFTER values are enforced with the AUTOMATIC parameter.

- ▶ **LINK====>Y/N (Process each command only if previous command succeeds?)**

- ▶ **PRINT====>Y/N (Generate listing of each member changed and saved?)**

A setting of Y allows IPT to present a prompt to confirm the printing of members that were altered as the result of a CHANGE command. This feature serves as an audit trail of changed members in a dataset.

- ▶ **EXCLUDE====> Y/N (Exclude failing members from selection list?)**

When this option is set to Y, all members in your MSL, which did not contain a match to the FIND or CHANGE argument, are automatically excluded. When set to N, it shows all of the members in your MSL, even if they did not contain a match to the FIND or CHANGE argument.

You can easily change the settings for Global commands when viewing a list of members from a dataset by issuing the G or Global command. Figure 3-5 depicts the Global EDIT command panel.

```

-IPT- ----- QUICK FIND AND GLOBAL EDIT COMMANDS -----
COMMAND ==>
SCROLL ==> PAGE

STOP AFTER ==> 9999 (Number of members to process successfully)
PROMPT AFTER ==> 50 (Number of members to process before prompt is issued)
START COLUMN ==> 1 (Quick FIND starting column in target data record)
END COLUMN ==> 99999 (Quick FIND end column in target data record)
AUTOMATIC ==> Y (Process without editing successful members?)
LINK ==> Y (Process each command only if previous command succeeds?)
PRINT ==> N (Generate listing of each member changed and saved?)
EXCLUDE ==> N (Exclude failing members from selection list?)
Specify below the ISPF EDIT commands or macros to be executed (one per line).
Press END to process the global commands, or enter CANCEL to cancel.

***** ***** Bottom of Data *****

```

Figure 3-5 Changing global settings for a specific search

### 3.7 Invoking a Find or Change command globally

There are two ways to invoke the Global FIND and CHANGE command:

- ▶ Option 1: Issue a primary command from the MSL, as shown in the following examples:
  - gl find RUSS
  - global FIND ‘Russell’
  - g change abc def all
- ▶ Option 2: Use the Global Edit Command panel shown in Figure 3-6 on page 100:
  - G
  - Global

When you use a Global FIND/CHANGE with parameters from the MSL primary command, which we described in Option 1, the ISPF Productivity Tool performs the Global FIND/Change operation:

- ▶ The searches are more efficient, requiring less time, CPU, and I/O:
  - A Global Find command locates the data, regardless of the case that is entered on the command line or the text within the members.
  - Global Find commands support case-sensitive, hexadecimal, and DBCS searches.

When you use the Global Edit Command panel, which we described in Option 2, ISPF functions are used to perform the Global Find and Change:

- ▶ Global Find and Change commands are case-insensitive, unless otherwise specified.
- ▶ Global Find and Change commands can be case sensitive:
  - You can use FIND C‘Sample’ to locate text in members that contain the word “Sample”. The “C” prefix ensures that the case matches during the search operation.
  - A command, such as Change c‘SAMPLE’ c‘Sample’ all, changes all syntax of SAMPLE to Sample.
  - Commands can be linked together.

- Global Find and Change commands can be hex sensitive.
- To locate or change a series of characters in hex:
  - G F x'81'
  - C x'81' x'82'
- Global Find and Change commands can include a column limit by specifying the start and end columns in the ISET Global setting.

## 3.8 Examples using the Global Find and Change commands

This section provides examples of the Global Find and Change commands. Figure 3-6 shows the results of a Global Find command G F IEBCOPY with the Global option AUTOMATIC=Y, EXCLUDE=Y, and PROMPT AFTER=50.

```

-IPT--GLOBAL EDIT ----DNET047.ADLAB.JCL on DMPU37-----
COMMAND ==>                                     Using quick search
50 of 68 members were processed. Member LINKLEXI is being processed.

STOP AFTER ==> 9999 (Number of members to process successfully)
PROMPT AFTER ==> 50 (Number of members to process before a prompt is issued)

IQIM376 50 Members processed. Press ENTER to continue or END key to quit

```

Figure 3-6 Results of a Global Find command with AUTOMATIC=Y, EXCLUDE=Y, and PROMPT=50

Figure 3-6 shows that IPT has processed 50 of the 67 members in the dataset. The summary panel indicates the status of each member – G:FAIL or G:OK. You can continue the search in order to process the remaining 17 members simply by pressing Enter. Notice that the upper lines of the display are a summary of the processing that has taken place. Just beneath the summary line, we have an opportunity to alter the current settings for the STOP AFTER and PROMPT AFTER global options.

Figure 3-7 on page 101 shows the result of the Global Find command with EXCLUDE.

```

-IPT--EDIT L1----- DNET047.ADLAB.JCL -----ROW 00001 OF 00002

***** Bottom of Data *****

```

Figure 3-8 Results of the Global Find command with AUTOMATIC=N and EXCLUDE=N

**For more information:** Refer to 12.5, “Settings for GLOBAL FINDTEXT” on page 317.

Setting the LINK field to Y allows you to link multiple find or change commands when you are working in an MSL. To specify the commands or macros which need to be executed, enter the command GLOBAL or G without operands. On the resulting panel, you can specify GLOBAL EDIT options and any number of ISPF EDIT commands using the EDIT facility in the lower half of the display.

If the LINK field is set to N, all of the arguments are processed without regard to the success or failure of the previous argument.

Figure 3-9 shows an example of specifying two FIND commands and one CHANGE command in the GLOBAL EDIT panel.

```
-IPT- ----- QUICK FIND AND GLOBAL EDIT COMMANDS -----

PRINT       ==> N   (Generate listing of each member changed and saved?)
EXCLUDE     ==> Y   (Exclude failing members from selection list?)
Specify below the ISPF EDIT commands or macros to be executed (one per line).
Press END to process the global commands, or enter CANCEL to cancel.

***** ***** Top of Data *****
000001 FIND iebcopy all
000002 FIND cics all
000003 change cics kies all
***** ***** Bottom of Data *****
```

Figure 3-9 Global Find example using the Global Edit commands panel

If you do not use the word ALL, and the member contains the find or change argument more than one time, IPT only changes the first reference that it finds.

Figure 3-10 depicts the final results of a Global Find with the EXCLUDE option set to N. You have the option of paging through your MSL to see all of the members that met the Global Find argument, or you can enter the SORT TEXT command or the SORT NOTE command, and the member list (regardless of the EXCLUDE setting) is sorted by the text of the first found row in each member.

## 3.9 MSL FINDTEXT

The FINDTEXT or FT command locates the first occurrence of the text string that is specified as the argument of the command.

The syntax of the command is simply FT <text\_string> <kwd>, where *text\_string* is the string to be found. The *kwd* can be FIRST, LAST, PREV, or NEXT. If the *text\_string* contains blanks or special characters, enclose the *text\_string* in quotation marks. Figure 3-13 on page 104 shows a FINDTEXT command.

Figure 3-14 Results of a FINDTEXT command

You can limit the number of members that you want IPT to process by setting the PROMPT AFTER option of the GLOBAL processing options. You can set these options using the ISET command or by typing a G when you are in an MSL, which we described in 3.5, “Changing the Global IPT defaults for your session” on page 97.

**Note:** Entering the FINDTEXT (FT) command without an argument brings up the Global Options panel, allowing you to change the Global Options for the FT command.

You can use the RFIND (repeat find) command to advance to the next occurrence of the FINDTEXT string. If you enter SORT TEXT or SORT NOTE, the members that contained the FINDTEXT string are sorted to the top of the member list.

When you view or edit a member that contains the data string, the FIND command, along with the object of the find, is automatically displayed on the command line. Figure 3-15 shows a selected member with the FINDTEXT string on the command line.

### 3.10 Partitioned dataset extended

Several years ago, IBM introduced a feature for the z/OS operating system called the partitioned dataset extended (PDSE). If you are unfamiliar with the advantages of using PDSEs over PDS datasets, refer to the following Web site for additional information about PDSE libraries:

[http://www.ibm.com/systems/storage/software/sms/whatis\\_sms/pdse.html](http://www.ibm.com/systems/storage/software/sms/whatis_sms/pdse.html)

A PDSE provides many advantages over a PDS:

- ▶ Directory searches are more efficient, because the directory is indexed and can be cached.
- ▶ Multiple members can be created simultaneously.

- ▶ A PDSE allows dataset-level sharing and member-level sharing.
- ▶ There are a maximum of 123 extents.
- ▶ You can load only a portion of a program object before control is passed.
- ▶ Additional control information is stored in the PDSE directory for program libraries.
- ▶ PDSE provides more efficient buffer management and caching capability for program libraries.
- ▶ PDSE offers improved alias management for PDSE program libraries.

### 3.11 Defining PDSEs

If your installation is installed as DFSMS/MVS with storage management subsystem (SMS) active, you can allocate PDSEs in SMS storage groups. The following parameters are required:

- ▶ Directory space greater than zero or DSORG=PO
- ▶ DSNTYPE=LIBRARY
- ▶ You can specify these parameters in one of these ways:
  - In a data class definition
  - On a JCL DD statement
  - Using the LIKE keyword
  - On a TSO/E ALLOCATE command
  - On the DYNALLOC macro
  - Through an installation default

### 3.12 When to use PDSs instead of PDSEs

Generally, a PDSE dataset is preferred because of the advantages that we have listed. However, there are certain situations when you need to continue to use PDSs rather than PDSEs:

- ▶ Use a PDS when allocating a checkpoint dataset. You cannot use a PDSE as a checkpoint dataset.
- ▶ When you define a program library that is used during initial program load (IPL), such as SYS1.NUCLEUS, SYS1.LPALIB, or SYS1.SVCLIB, use a PDS.
- ▶ You need to ship the dataset to or share the dataset with a system that does not support PDSEs.
- ▶ An application that uses the dataset does not support PDSEs. For example, it uses EXCP, EXCPVR, or XDAP.
- ▶ An application that uses the dataset is dependent on processing short blocks or sequential access method (SAM) record null segments.

### 3.13 Using ISPF concatenated libraries to manage change

An *ISPF library* is a cataloged partitioned dataset with a three-level dataset name in this format:

*project.group.type*

Using ISPF, you can concatenate up to four ISPF libraries with the same project and type, as shown in Figure 3-21.

```
ISPF Library:
Project . . . PAYROLL
Group . . . SMITH . . . DEVELOP . . . MASTER
Type . . . PLI
Member . . . (Blank or pattern for member selection list)
```

Figure 3-21 ISPF library

Using an ISPF Productivity Tool Object List, you can specify the same library structure as:

*=project group1 ... group4 type*

Figure 3-22 shows how you can define an ISPF library using an IPT Object List.

```
-IPT- OLIST (E) ----- Objects List ----- Row 1 to 1 of 1
Command ==> _ SCROLL ==> PAGE
Hotbar: FILT JCL
Open list ==> TEST (or BLANK for reference list)
TSO PARMS ==>
Command Member Numbr Data Set Names / Objects Class
-----
1 =DNET187 TEST PROD COPYLIB ISPF
-----
END OF LIST -----
```

Figure 3-22 SPF library defined by an Object List

ISPF libraries can be PDS or PDSE libraries. They might also be IBM Software Configuration and Library Manager (SCLM) libraries.

Chapter 13, “SCLM integration with IPT” on page 329 demonstrates the use of SCLM with the IPT Member Selection Lists.

ISPF libraries provide an easy way to separate the changes that you make from the “production” library. If a member is modified, a version is saved in library1 or group1. Therefore, if the original member is not in group1, the original version is not lost.

There are several IPT commands that are designed to expedite your work when you use ISPF libraries or SCLM libraries:

- ▶ PROject: Switch to another project qualifier.
- ▶ LIB: Add, remove, or switch to another library.

- ▶ TYPE: Switch to another library type.
- ▶ WHERE or the H line command: Shows which libraries contain the member.

Let us look at how to use the ISPF libraries with IPT, beginning with Figure 3-23. Here, we use an Object List Concatenated dataset.

```

-IPT- OLIST (E) ----- Objects List ----- Row 1 to 1 of 1
Command  ===> 1- SCROLL ==> PAGE
Hotbar:  FILT JCL
Open list  ==> TEST (or BLANK for reference list)
TSO PARMS  ==>
Command  Member      Numbr Data Set Names / Objects      Class
-----
1  =DNET187 TEST PROD COPYLIB      ISPF
-----
END OF LIST

```

Figure 3-23 Using an Object List Concatenated dataset

In Figure 3-24, DNET187.TEST.COPYLIB identifies the group1 library. The LIB2=PROD identifies the second library in the concatenation. To switch from SOURCE to JCL libraries, use the TYPE command.

**Note:** In Figure 3-23, the ISPF value is in the Class field. The equal (=) sign denotes an ISPF library in the OLIST.

```

Figure 3-28 Result of the WHERE MSL command

The DSN command switches the Member Selection List to another dataset. If the DSN command is entered without parameters, it invokes Option 2 of IPT.

The DSN command allows you to change the library name or the invocation parameters that might not be available using the Member Selection List; for example, you can enter an EDIT/VIEW initial Macro or profile name. In Figure 3-29 on page 113, we entered LOAD for the library TYPE in Figure 3-29 on page 113.

```

-IPT--LI ----- EDIT - ENTRY PANEL -----
COMMAND ==>
HOTBAR?

ISPF Project ==> DNET187
Group ==> TEST ==> PROD ==>
Type ==> LOAD
Member ==> (Blank or member name or extended pattern)
Other data set, VSAM file, or z/OS UNIX file:

## 3.14 MSL Point-and-Shoot fields

The ISPF Productivity Tool provides a large number of Point-and-Shoot fields on the Object List and Member Selection panels. To use a Point-and-Shoot field, put your cursor under the field label, and press Enter.

The Member Selection List panel provides the following Point-and-Shoot fields:

- ▶ EDIT/BROWSE/VIEW
- ▶ Dataset history
- ▶ Tailor Messages
- ▶ Column headings:
  - NAME
  - RENAME
  - LIB
  - VV.MM
  - CREATED
  - CHANGED
  - SIZE
  - INIT
  - MOD
  - USERID
- ▶ HOTBAR

In this section, we describe the location and use of each of the fields listed.

In Figure 3-32 on page 115, the action field changes from EDIT to BROWSE to VIEW when using the Point-and-Shoot function. This action equates to using the DEFAULT command.

17 'DNET187.ADLAB.SYSDEBUG'

```

Figure 3-34 Dataset history Object List

IPT automatically retains the last 100 datasets that you have used, which are presented when you request the history datasets by using the Point-and-Shoot action.

The Tailor Message field can also be a Point-and-Shoot field. The example in Figure 3-35 shows the results of the FILTER C\* command, which reduced the number of members shown.

```

## 3.15 MSL HOTBARS

The MSL HOTBAR feature provides a unique way for you to tailor your MSL panel with frequently used IPT commands using Point-and-Shoot technology.

When you first use IPT, the HOTBAR fields are not populated. You can update the HOTBAR fields by using the HOTBAR? heading as a Point-and-Shoot field, as shown in Figure 3-38 on page 118.

## 3.16 Advanced Member Selection List functions

The Advanced Functions in the Member Selection List allow you to perform maintenance type functions on PDS libraries and advanced utility functions on members and data. In this section, we show you how to use several of the advanced MSL functions to improve ISPF productivity:

- ▶ Compress: Compress the displayed library or libraries.
- ▶ Empty: Empty all data from a partitioned dataset or a sequential dataset.
- ▶ Expdir: Expand the directory of a partitioned-library dataset object.
- ▶ Info: Display dataset information for the library or libraries being processed.
- ▶ Lmap: Display the module members for Load Library.
- ▶ Move: Move one or more members to a target library.
- ▶ Mappds: Display a data map of a PDS library.
- ▶ Tailor: Define and use a string of MSL commands.

### 3.16.1 IPT Support for PDS libraries: Automated compress/directory expansion

Even though most z/OS mainframes support PDSE libraries, many people still use PDS libraries. If the PDS you use requires maintenance, IPT can guide you through the required steps to correct the problem.

The Save command attempts to save a new member XSAMTEST as shown in Figure 3-41 on page 120.

```

-IPT- EDIT DNET187.ADLAB.JCL1(XSAMTEST) - 01.00 Columns 00001 00072
Command ==> save Scroll ==> PAGE

```

Figure 3-41 Saving a PDS member

The DNET187.ADLAB.JCL PDS has no directory blocks available, and saving the member fails as shown in the IPT Intercepts Directory Stow error in Figure 3-42.

```

-IPT- EDIT ----- DNET187.ADLAB.JCL1(XSAMTEST) on DMPU38 -----
COMMAND ==>

You have issued a SAVE request for the following member: XSAMTEST

Your request has failed because there is not enough room in the library
directory.

The SAVE request may be successful if IBMIPT expands the directory.

Expand the directory and then save? ==> Y (Y=yes,N=no)

Specify your choice and press ENTER.

IQIS038 Please confirm the EXPDIR request before saving the member

```

Figure 3-42 IPT Intercepts Directory Stow error

To expand the directory, press Enter to continue. IPT has expanded the directory and successfully allows the member to be created as shown in Figure 3-43 on page 121.

```

-IPT- EDIT DNET187.ADLAB.JCL1(XSAMTEST) - 01.00      Member XSAMTEST created

000021 /**** //INSPREF DD DSN=8SYSUID..ADLAB.DTPREF,DISP=SHR

```

Figure 3-43 Member created

IPT expanded the directory and saved the member XSAMTEST, which is a significant improvement over ISPF. ISPF requires steps similar to the following steps:

1. Split the panel.
2. Navigate to ISPF option 3.2.
3. View the DNET187.ADLAB.JCL.CNTL1.
4. Exit.
5. Allocate a similar library with additional directory blocks as DNE187.ADLAB.JCL.CNTL1.NEW.
6. Navigate to ISPF option 3.3.
7. Copy all members from DNET187.ADLAB.JCL.CNTL1 to the newly allocated library.
8. Swap to the original library.
9. Save the new library with the line command **C9999** to save the member in the new PDS.
10. Exit from option 2.
11. Delete the original PDS library.
12. Rename the new PDS library to DNET187.ADLAB.JCL.CNTL1.

Figure 3-44 on page 122 shows issuing the save command and shows the changes that were made to DNET187.ADLAB.JCL1(XSAMRZ). The **save** command is issued to save the changes.

```

-IPT- EDIT DNET187.ADLAB.JCL(XSAMRDZ) - 02.17 Columns 00001 00072
Command ==> Save Scroll ==> PAGE
***** Top of Data *****
==MSG> -Warning- The UNDO command is not available until you change
==MSG> your edit profile using the command RECOVERY ON.
000001 //DNET187X JOB (ACCTG), 'DNET187', CLASS=A, MSGCLASS=H, MSGLEVEL=(1,1),
000002 // REGION=5000K, NOTIFY=DNET187
000003 //*****
000004 //*****

000015 // REGION=4M
000016 //* //CEE0PTS DD * (CEE0PTS IS AN OPTIONAL WAY TO START DT )
000017 //* TEST(,,MFI%TRMLU999:)
000018 //STEPLIB DD DSN=8SYSUID..ADLAB.LOAD, DISP=SHR
000019 // DD DSN=DEBUG.V8R1.SEQAMOD, DISP=SHR

```

Figure 3-44 Issuing the save command

However, the save request failed, because there is insufficient room in the library. IPT captures the failure and provides the function to dynamically compress the library and continue to save the file. In Figure 3-45, the confirmation is set to Y to continue with compressing the library.

```

-IPT- EDIT ----- DNET187.ADLAB.JCL1(XSAMRDZ) on DMPU38 -----
COMMAND ==>

You have issued a SAVE request for the following member: XSAMRDZ

Your request has failed because there is not enough room in the library.

The SAVE request may be successful if IBMIPT first compresses the library.

Compress the library and then save? ==> Y (Y=yes,N=no)

Specify your choice and press ENTER.

IQIS035 Please confirm the COMPRESS request before saving the member

```

Figure 3-45 IPT captures the save failure

Figure 3-46 on page 123 depicts pressing Enter to compress the library and to continue to save the library. The member is successfully saved. This function, which is provided with IPT, saves you many steps compared to the same actions in native ISPF.

```

```

Figure 3-46 Member saved successfully

### 3.16.2 Using EMPTY and COMPRESS on a PDS

IPT provides an easy method to delete all of the members in a PDS and to compress the library. In Figure 3-47, we entered the **empty** command to delete all of the members in the PDS library DNET187.ADLAB.TESTJCL.

```

-IPT--EDIT L1----- DNET187.ADLAB.TESTJCL -----ROW 00001 OF 00096
COMMAND ==> empty SCROLL ==> PAGE
HOTBAR?

```

Figure 3-52 Move \* command

You will be prompted for a target library to receive the members that are being moved. We entered DNET187.PROD.COPYLIB in the Dataset Name field to identify the target library as shown in Figure 3-53.

```

-IPT----- MOVE from DNET187.TEST.COPYLIB -----
COMMAND ==>

15 members will be processed.
Specify "TO" data set below:

PROJECT ==> DNET187
GROUP   ==> TEST
TYPE    ==> COPYLIB

Or other Partitioned, Sequential Data Set or @H (History List):
DATA SET NAME ==> 'dnet187.prod.copylib'
VOLUME SERIAL ==> (If not catalogued)
PASSWORD      ==> (If password protected)

MOVE OPTIONS:
REPLACE like-named library members ==> N (Y=Yes, N=No, 0=Target is Older)
Disposition for sequential target ==> OLD (OLD or MOD)
Note: If statistics are not available, replace option 0 (older) is
treated as option Y (Yes).
Press ENTER to move END key to cancel.

```

Figure 3-53 Identify target library

**Note:** In Figure 3-53, the “REPLACE like-named library members” selection of 0 allows the MOVE operation to occur only if the target member is older than the source member, which minimizes the risk of accidentally destroying your data.

Figure 3-54 on page 127 depicts all of the members prior to the MOVE operation, which gives you an opportunity to rename members.

```

-IPT--EDIT----- MOVE GROUP -----
COMMAND ==> _

You have requested that 15 members be MOVED to DNET187.PROD.COPYLIB.

Indicate a new member name in the RENAME column, or leave it blank to
use the same member name.

      Press ENTER to process the list, or the END key to cancel.
      (Use the PF keys for scrolling to see the entire list.)

      NAME      RENAME      LIB VV.MM CREATED      CHANGED      SIZE  INIT   MOD USERID

### 3.17 Using the TAILOR command

The TAILOR command defines and initiates one or more MSL commands. You can define the commands using Option 1, Option 2, or by using a Member Selection List.

As shown in the IPT Option 1 or 2, the Browse/View or View panel provides a field that is labeled Do TAILOR (Figure 3-57).

```

-IPT--L1 ----- EDIT - ENTRY PANEL -----
COMMAND ==>
HOTBAR?

ISPF Project ==> DNET187
Group ==> ADLAB ==> ==> ==>
Type ==> JCL1
Member ==> (Blank or member name or extended pattern)
Other data set, VSAM file, or z/OS UNIX file:
@H for History-List or @L for 'DNET187.ADLAB.COPYLIB'
Name/Pattern ==> +
Volume serial ==> (Optional VOLSER or pattern for selection list)
Password ==> (If password protected)
Default func. ==> E (B=Browse, V=View, E=Edit, BF, EF, VF, or ?)
Do TAILOR ==> d (Y=Yes, N=no, D=define commands)
EDIT/VIEW parameters:
Initial Macro ==> Confirm Cancel/Move/Replace ==> N (Y,N)
Profile Name ==> Action Bar in Edit/View ==> N (Y,N)
Format Name ==> Highlight coloring in Edit/View ==> Y (Y,N)
Record Length ==> Exclusive access of viewed file ==> Y (Y,N)
Preserve VB record length ==> N Mixed Mode (NLS DBCS char. set) ==> N (Y,N)

```

Figure 3-57 Tailor command

Entering **d** allows you to define commands, as shown in Figure 3-58 on page 129.

```

-IPT- -----MSL TAILOR COMMAND-----
COMMAND ==>

Member List commands executed by TAILOR command:
==> FILTER B*;SORT CHA

Examples:
==> FILTER USERID DNET187
==> FILTER ACT*A;SORT CHANGED

Other Member Selection List options:
Automatic preview (with LOCATE/FIND) ==> Y (Y=Yes, N=No)
Replace existing members (COPY/MOVE) ==> N (Y=Yes, N=No, 0=Target Older)

Press ENTER to execute, END key to return to previous screen.

```

Figure 3-58 Tailor command definition

Figure 3-58 shows the command **FILTER B\***, which retains only members starting with B. The **SORT CHA** command sorts the remaining members by descending date and time. You can update the Automatic preview field and the Replace existing members field on this panel.

As shown in Figure 3-59, the Do TAILOR command, which executes the tailoring, is automatically set to Y. Press Enter to browse the MSL using the Tailor commands.

```

Figure 3-60 Tailor command used with the MSL

Members are listed in the Changed column in descending date and time sequence. There are 83 hidden members that do not meet the Tailor criteria.

You can invoke the TAILOR command directly from the MSL panel that is shown in Figure 3-60, for example, the command "TAILOR?" invokes the MSL TAILOR COMMAND panel. The command TAILOR executes the currently defined commands from the Member Selection List.

### 3.17.1 Using the MAPPDS command to recover deleted PDS members

The MAPpds command provides a method to display and recover members that were deleted from a PDS. In this scenario, members will be deleted and recovered.

Note: This function is available until the library is compressed and is not available for PDSE.

In the following scenario, we will delete and recover members from a PDS. In Figure 3-61, we used the **d b\*** command to delete all members that begin with B.

```

-IPT--EDIT L1----- DNET187.ADLAB.TESTJCL -----ROW 00001 OF 00095
COMMAND ==> d b*
HOTBAR?

```

Figure 3-65 Assist on the Restore Command

The restore command allows you to restore one or more deleted members in a PDS that has not been compressed. If you specify a member name in the name column or on the line command for the restore, the specified member name must be unique. The default member name is the synonym.

Figure 3-66 on page 133 is the result of the Assist on Restore command and shows the information that is provided by IPT for the syntax of the Restore command.

-IPT--PDS-MAP L2-- DNET187.ADLAB.TESTJCL -----ROW 00001 OF 00095						SCROLL ==> PAGE	
COMMAND ==>

9Z000901							-----Assist -----
9Z000809			Function:	Restore one or more deleted members			
9Z00080B							
9Z000605			Syntax:	Restore <seqn> <name>			
9Z000603				R <Fseq>-<Lseq>			
9Z000601			Where:	<seqn> is a deleted member sequence number.			
9Z000503				<name> is a deleted member unique name.			
9Z000501				<Fseq> is first sequence number or "*" .			
9Z000413				<Lseq> is last sequence number or "*" .			
9Z000301							
9Z000209			Examples:	R 5 OLDDONE - Restore deleted member number 5			
9Z000207				as member name OLDDONE .			
9Z000107				R * - Restore all deleted members.			
9Z000105				R 7-9 - Restore deleted at entries: 7 8 9			
9Z000D17							
9Z000D03			Notes:	- The specified member name must be unique.			
9Z000D01				- NAME field may be input with restored name.			
9Z000C07				- The default member name is the SYNONYM.			
9Z000C0F				- Deleted members are lost after a COMPRESS!			
FMRIP							

Figure 3-66 Results of the Assist on Restore command

These examples demonstrate the Assist on Restore command:

- ▶ R 5 OLDDONE: Restores deleted member number 5 as the member name OLDDONE.
- ▶ R \*: Restores all deleted members. This command renames all of the deleted members to Synonym names.
- ▶ R 7-9: Restores deleted member entries: 7, 8, and 9

Figure 3-67 shows the Restore command, which is used to restore one deleted member to a member named BCCOB.

```

Figure 3-68 Restore results

### 3.17.2 Using the expanded member name field

The expanded member field in IPT was introduced to support finding member names with patterns that exceed eight characters. For example, if you have members ABCDEFGH and BCDEFGHX, the minimum way to find them in a single pattern is \*BCDEFGH\* or \*\*B\*C\*DEFGH\*.

This function is available in the ISPF Browse and Edit views. It is also available in the IPT shortcuts BR, ED, and VI.

Figure 3-69 shows an example of the expanded Member name field. The Member field is populated with pattern \*\*b\*c\*defgh\*, which is longer than eight characters.

```

-IPT--L1 ----- EDIT - ENTRY PANEL -----
COMMAND ==>

## TSO Command Shell

In this chapter, we discuss the enhanced Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS functions that the Time Sharing Option (TSO) Command Shell provides.

The TSO Command Shell generally provides two sets of command lists:

- ▶ History Command List
- ▶ Permanent Command List

The maximum capacity of the IPT TSO Command Shell Permanent Command List and the History Command List is up to 999 commands. The TSO shell commands are retained after you log off from TSO and are available when you log on again.

The 999 history commands can be executed from TSO Option 6, and the 999 permanent commands can be executed from any ISPF panel.

## 4.1 Validating the TSO Command Shell options in IPT

In this section, we provide information about the IBM IPT Version 6.1 TSO Command Shell.

To validate the TSO shell options in IPT, type ISET as a primary command as shown in Figure 4-1.

```
Menu Utilities Compilers Options Status Help
ISPSP Primary Option Menu
Option ==> ISET
More: +
0 Settings      Terminal and user parameters      User ID : R09713
1 View          Display source data or listings    Time. : 15:19
2 Edit          Create or change source data       Terminal : 3278
3 Utilities      Perform utility functions          Screen : 1
4 Foreground     Interactive language processing    Language : ENGLISH
5 Batch          Submit job for language processing  Appl ID : ISP
6 Command        Enter TSO or Workstation commands   TSO logon : IPTBETA
7 Dialog Test    Perform dialog testing             TSO prefix: R09713
9 IBM Products   IBM program development products  System ID : EARTH
10 SCLM          SW Configuration Library Manager  MVS acct. : ACCTH
11 Workplace     ISPF Object/Action Workplace       Release : ISPF 5.8
D DB2           Perform DB2 Interactive Functions
Q QMF            Query Management Facility
S SDFII          Screen Definition Facility
O OmegaMon       Omegamon XE for DB2 PM v4.1
SD SDSF          System Display and Search Facility
P Master         Primary Master Menu

Enter X to Terminate using log/list defaults
```

Figure 4-1 Showing the ISET command for IPT Version 6.1

**Note:** Alternatively, you can type the ISET T command from any ISPF panel as a shortcut to select the IPT TSO shell options panel that is shown in Figure 4-3.

Select the TSO shell options (Figure 4-2).

```
-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==>
Select options by number, name, with cursor selection, or with line commands:
IBMIPT is running under ISPF version 5.8

- A - ALL          - Select all the below displayed options
- M - MSL          - Member Selection List options
- O - OLIST        - Object list options
- G - GLOBAL       - Global edit and Findtext options
- P - PRINT        - Print options
- D - DSLIST       - DSLIST options
- S - TSO          - TSO shell options
- E - EDIT         - Edit, Browse and View options
- I - INTERFACE    - Specify user interface options
- N - DIAGNOSE     - Diagnose ISPF errors
- L - LIBRARY      - Persistent table library options
- B - BOOKMGR      - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit
```

Figure 4-2 TSO shell options selection

Make sure that you set the “Use IBM IPT TSO shell” option to Y, as shown in Figure 4-3.

```
-IPT- -----TSO shell options-----
COMMAND ==>

IBMIPT TSO command shell options:

  Use IBMIPT TSO shell ==> Y (Y=Yes - Use the IBMIPT TSO shell)
                               (N=No - Use the standard ISPF TSO shell)

  If IBMIPT shell active:

    Initial screen      ==> H (H=History list, P=Permanent list)
    Automatic filling   ==> Y (Y=Yes - Automatically fill permanent list, N=No)
    Output line number ==> 7 (Number of screen line where the output of TSO
                               commands is displayed)
    Command list limit ==> 999 (History and Permanent maximum number of entries)

  Press ENTER or END to exit. Enter CANCEL for installation defaults.
```

Figure 4-3 TSO shell options in ISET

**Note:** The IPT normal setting for new users is 100 instead of 999. However, the Command list limit that is circled in Figure 4-3 allows you to override the History and Permanent command list limit. In addition, the Automatic filling option that is circled in Figure 4-3 enters your TSO shell commands into the Permanent Command List, in the next available empty slot.

The maximum number of rows in the TSO shell command lists is fixed as 999 for each list. Hence, the Permanent or History table can accommodate approximately 999 x 234 bytes of virtual memory. Thus, these tables together can occupy almost 2 MB of virtual memory and external space in the persistent table library. However, users can lower or customize the maximum number of rows in the TSO shell command lists by using the IPT customization wizard IQIWIZRD.

## 4.2 Using IQIWIZRD to customize the TSO shell command list

Type the IQIWIZRD command in the ready prompt as shown in Figure 4-4 on page 138.

```
DDS1019.SPFL0G1.LIST has been deleted.  
READY  
IQIWIZRD  
%IQIWIZRD INVOKED, PLEASE WAIT *** _
```

Figure 4-4 IQIWIZRD to invoke IPT Customization wizard

When prompted, type the SIQITLIB library name as shown in Figure 4-5.

```
PLEASE ENTER THE NAME OF THE -IPT- TABLE LIBRARY OR JUST PRESS ENTER TO EXIT.  
EXAMPLE: IQI.SIQITLIB  
====> 'IPT.V6R1BETA.SIQITLIB'
```

Figure 4-5 SIQITLIB dataset library in IQIWIZRD

Again when prompted, type the IQIPLIB library name as shown in Figure 4-6 on page 139.

```

PLEASE ENTER THE NAME OF THE -IPT- TABLE LIBRARY OR JUST PRESS ENTER TO EXIT.
EXAMPLE: IQI.SIQITLIB

==> 'IPT.V6R1BETA.SIQITLIB'

PLEASE ENTER THE NAME OF THE -IPT- PANEL LIBRARY OR JUST PRESS ENTER TO EXIT.
EXAMPLE: IQI.SIQIPLIB

==> 'IPT.V6R1BETA.SIQIPLIB'

```

Figure 4-6 SIQIPLIB dataset library in IQIWIZRD

Follow the instructions that are provided by the IPT Installation, and press Enter to see the IBMIPT - Customization Wizard as shown in Figure 4-7.

```

----- IBMIPT - Customization Wizard -----
COMMAND ==> 1_
Please select which tasks you want to perform:
1 Customization      - Set up IBMIPT options and defaults.
X EXIT              - Exit - do not customize, do not set up password.
Make selection and press the Enter key or press the END key to exit.

===== Web Link =====
http://www.ibm.com/software/awdtools/ispfproductivitytool
=====

PREVIOUS DEFAULTS WERE UPDATED BY DDS1019 ON 02/12/09 AT 01:40:03

```

Figure 4-7 IPT Customization Wizard

Continue to press Enter until you get the TSO Command Shell option in the Customization Wizard (Figure 4-8 on page 140).

```

----- IBMIPT - Customization Wizard -----
COMMAND ==>

IBMIPT provides an alternative TSO command shell that provides
command history, permanent commands entries, execution of ISPF dialog
manager statements, and substitution of data sets pointed by the
cursor (create your own point-and-shoot commands).
For example, if a permanent entry number 5 is defined as:
    %TRANSFER SYSB.JONES DSN(/)
then by entering "TSO 5" on any ISPF screen while placing the cursor
on a data set name appearing on that screen would execute the
%TRANSFER command on the pointed data set.

The SET command is used to activate or deactivate the IBMIPT TSO command shell
For users who have not yet used IBMIPT, indicate the desired defaults:
  Use IBMIPT shell    ==> Y (Y=Yes - Use the IBMIPT TSO shell, N=No)
  Output line number ==> 7 (Number of screen line for TSO command output)
  Initial screen     ==> H (H=History list, P=Permanent list)
  Command list limit ==> 100 (History and Permanent maximum number of entries)
  Automatic filling  ==> Y (Y=Yes - Automatically fill permanent list, N=No)
  History recording  ==> L (F=Full - Every command put in history list)
                      (L=Limited - Build a table of commands that are
                      not put in the history list. Use this option
                      to hide security-sensitive commands).

```

Figure 4-8 TSO shell options in the IBMIPT - Customization Wizard

The users can customize the Command list limit as is shown (circled) in Figure 4-8. However, the ISET T command allows the user to override this Customization Wizard setting.

## 4.3 IPT History Commands List

The IPT History Commands List can store up to 999 entries automatically. When you enter a new command in the History Commands list, the new command is added as the first entry and the remaining commands are pushed down the list.

### 4.3.1 Using the TSO Command Shell with the IPT History Command List

Follow these steps:

1. Select **Option 6** in TSO to use the command shell.
2. Invoke a command in TSO Command Shell by typing *n* on the TSO Command Shell, where *n* is the command number.
3. Invoke a command in TSO Command Shell by entering *?n*, which allows you to modify the command prior to execution.
4. Edit the IPT History Command List, and update the IPT History Command List by typing the **/EH** command.
5. Type the IPT History Command shortcut **EX=** to display the most recent History Command. The **EX=** command always displays the History Command List regardless of the TSO shell default settings.

Use slash (/) as a variable for substitution point-and-shoot variables.

Figure 4-9 on page 141 shows the History Command List.

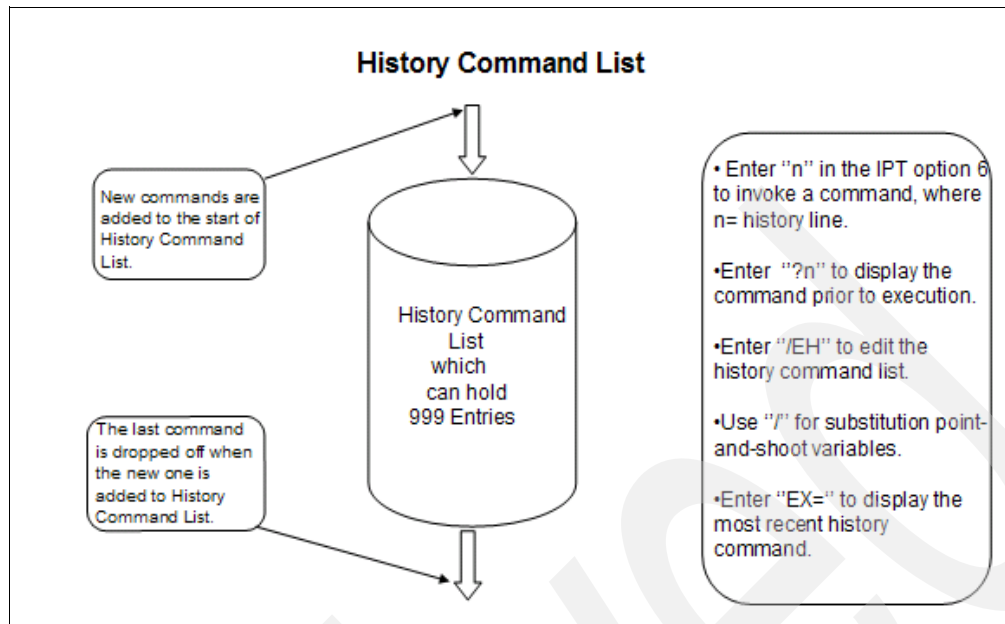

Figure 4-9 IPT History Command List

## 4.4 IPT Permanent Command List

The IPT Permanent Command List can store up to 999 entries automatically. You can invoke Permanent Commands from any ISPF panel.

### 4.4.1 Using the TSO Command Shell with the IPT Permanent Command List

Follow these steps:

1. Enter **Option 6** in TSO to use the command shell.
2. Invoke a command in TSO Command Shell by typing *n* on the TSO Command Shell, where *n* is the permanent command line.
3. Invoke a command in TSO Command Shell by typing *?n*, which allows you to modify the command prior to execution.
4. Edit the IPT Permanent Command List and update the IPT Permanent Command List by typing the **/EP** command.
5. Enter the IPT Permanent Command shortcut **EX?** to identify how many Permanent Commands are present and their respective sequence numbers. The **EX?** command always displays the Permanent Command List regardless of the TSO shell default settings.

Use slash (/) as a variable for substitution point-and-shoot variables.

You can invoke the Permanent Command List from any ISPF panel by performing these tasks:

- ▶ Typing **EXn**, where *n* = 1 to 9, representing one of the first nine permanent commands.
- ▶ Typing **TSO n** where *n* = 1 to 999.

Figure 4-10 on page 142 shows the Permanent Command List.

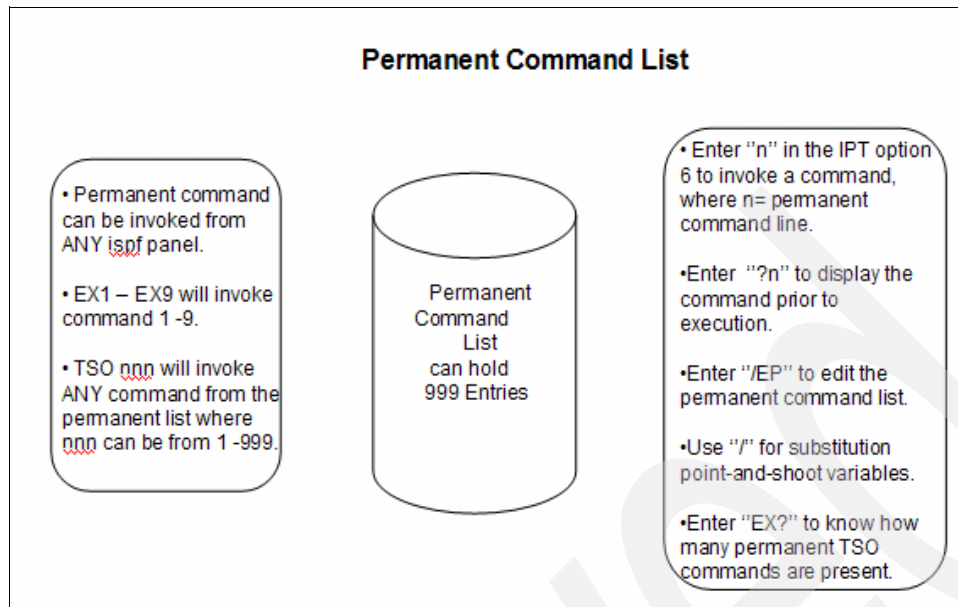

Figure 4-10 IPT Permanent Command List

## 4.5 TSO Command Shell list

IPT Option 6 displays the panel that is shown in Figure 4-11 on page 143. You can enter the following commands from this panel:

<b>n</b>	Executes any of the 999 commands.
<b>?n</b>	Displays any of the 999 prior to execution.
<b>/IS</b>	Navigates to the ISPF command shell option.
<b>/EH</b>	Allows you to edit and update the History Command List.
<b>EX=</b>	Displays the most recent History Command.
<b>/P</b>	Displays the Permanent Command List.
<b>EX?</b>	Identifies how many Permanent Commands were entered.
<b>/EP</b>	Allows you to edit and update the Permanent Command List.
<b>/SAV</b>	Saves the Command List that is shown.
<b>/RES</b>	Restores the Command List that is shown.

Use the **/SAV** command to save the Command List. However, when you exit IPT, both Permanent Command Lists and History Command Lists are automatically saved. But if the user gets cancelled without a prior **/SAV** after modifying or accidentally deleting the Permanent Command List, the changes will be lost from the memory.

**Note:** The **EX=** command can be used as a shortcut to display the History Command List from the TSO Command Shell regardless of the TSO Shell Default settings. Similarly, the **EX?** command can be used as a shortcut to display the Permanent Command List from the TSO Command Shell regardless of the TSO Shell Default settings.

## 4.5.1 Demonstration of TSO History Command List options

Next, we demonstrate the *n* command in the TSO History option:

Figure 4-11 and Figure 4-12 demonstrate the use of the *n* command from the History Command List where *n* is any number from 1 to 999.

```
-IPT-                                TSO COMMAND SHELL                                Row 1 to 13 of 25
IQIP627 LISTA executed. Return code is zero.
Command ==> ?5

Enter: TSO command, CLIST, REXX EXEC, or ISPEXEC statement.      Scroll => CSR

Figure 4-12 Results of LISTA command

### Demonstrating the ?*n* command in the TSO History option

Figure 4-13 on page 144 demonstrates the use of the ?*n* command from the History Command List where *n* is any number from 1 to 999. The ?*n* command provides you with the exclusive option to display the command and modify the command if needed prior to executing the command.

```

-IPT-                                TSO COMMAND SHELL                                Row 1 to 13 of 25
IQIP627 LISTA executed. Return code is zero.

11                                     ->
12                                     ->
13                                     ->

```

Figure 4-20 The result of the /EH entry in the TSO History Command Shell

**Note:** You can also use the **TSO =** command as a shortcut to display the History Command List from the TSO Command Shell, regardless of the TSO Shell Default settings. This command is identical to the **EX=** command previously demonstrated. The only difference between the **TSO =** command and the **EX=** command is that the **TSO =** command has an embedded space whereas **EX=** does not an embedded space. In addition, you can also use the **TSO?** command as a shortcut to display the History Command List. However, the **TSO ?** command does not recall the last History command that was executed.

## 4.5.2 Demonstrating TSO Permanent Command List options

Next, we demonstrate the `/P` command to get the TSO Permanent Command Listing. Figure 4-21 demonstrates the use of the `/P` command, which helps to display the Permanent Command List from the TSO Command Shell panel. You can type the `/P` command in ISPF Option 6 to display the Permanent command list.

```
-IPT-                                TSO COMMAND SHELL                                Row 1 to 13 of 26
*** Press ENTER to execute the displayed command. ***
Command ==> _

Enter: TSO command, CLIST, REXX EXEC, or ISPEXEC statement.      Scroll => CSR
/IS standard ISPF/TSO, /P permanent
/EH edit history, /EP edit permanent, /SAV save, /RES restore
<c><entry number> where <c> is ? or / or omitted.

----- HISTORY COMMAND LIST -----
1  LU                                ->
2  lista                            ->
3  xmit dalmvs50.d659713 da('R09713.SAMPLE.TEST') ->
4  HOMETEST                         ->
5  obrowse                          ->
6  racf                             ->

## IPT Global Commands

Are you new to Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS? IPT is powerful, fast, rich in features, and complex. However, all you really need to know is the **IPT?** command.

**Note:** IPT Global Commands are also known as *IPT Command Shortcuts*.

## 5.1 IPT Global commands

Type `IPT?` on a command line in any ISPF or IPT panel (Figure 5-1).

```
Menu  Utilities  Compilers  Options  Status  Help

ISPf Primary Option Menu

Option ==> ipt?_

0  Settings      Terminal and user parameters
1  View          Display source data or listings
2  Edit          Create or change source data
3  Utilities     Perform utility functions
4  Foreground    Interactive language processing
5  Batch         Submit job for language processing
6  Command       Enter TSO or Workstation commands
7  Dialog Test   Perform dialog testing
P  IBM Products  IBM program development products
10 SCLM          SW Configuration Library Manager
11 Workplace     ISPF Object/Action Workplace
12 z/OS System   z/OS system programmer applications
13 z/OS User      z/OS user applications

Enter X to Terminate using log/list defaults
```

Figure 5-1 Command line with `ipt?` command

Press Enter. Figure 5-2 shows the Command Shortcuts panel.

```
-IPT-                                COMMAND SHORTCUTS                                Row 1 of 55

Figure 5-2 First Command Shortcuts panel

Whether you are unfamiliar with IPT or whether you are an experienced user looking for a particular command's syntax, the `IPT?` command is your quick, concise, online resource for IPT information.

### 5.1.1 Command Shortcuts panels tour

If you navigate to the Web site that is shown beneath the command line on Figure 5-2 by using your favorite browser, you see more information about the IBM ISPF tool family. See Figure 5-3 on page 155.

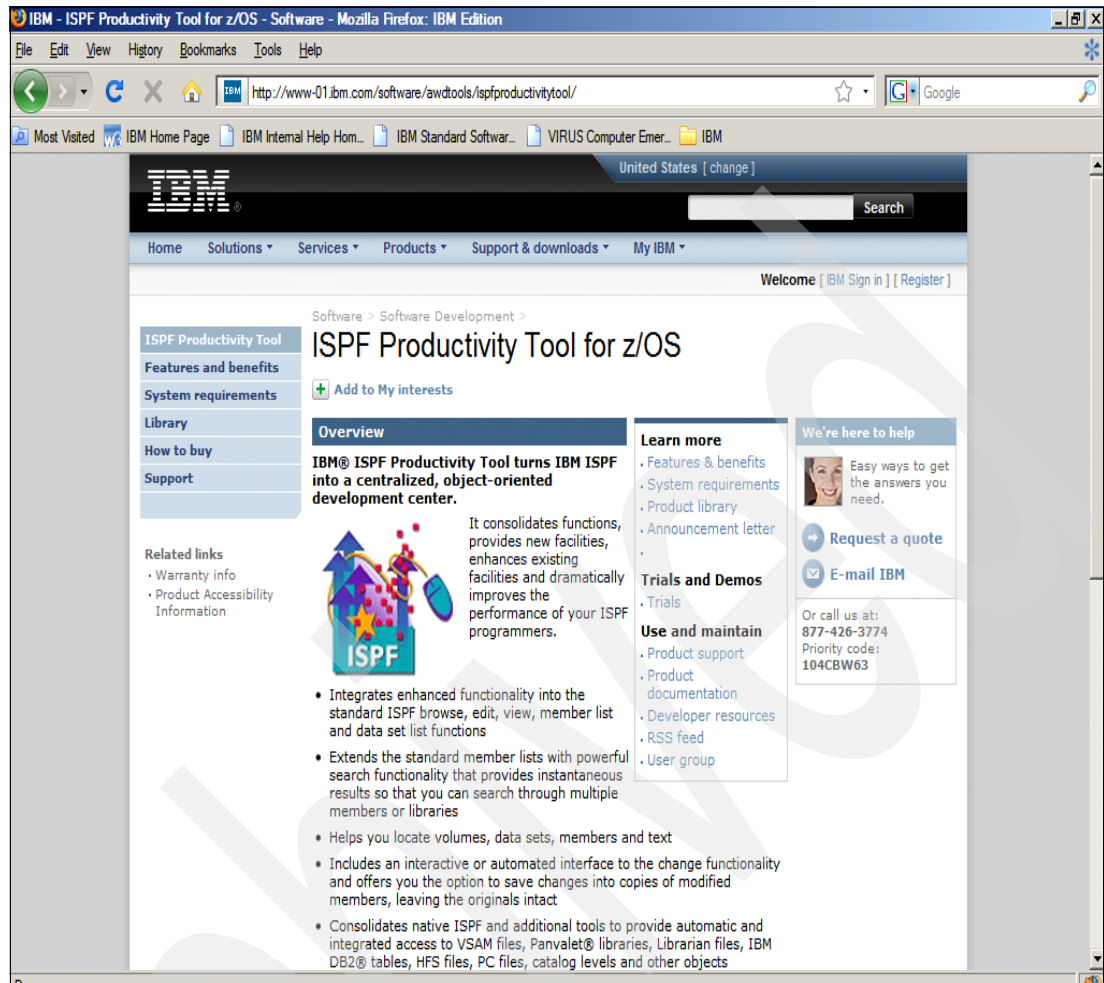

Figure 5-3 IBM ISPF Web site

Go to this Web site:

Figure 5-4 Command Shortcuts panels

There are 55 rows through which to scroll. **IPT?** has a rich set of command shortcuts. Notice that the commands listed on the panel are not displayed in alphabetical order. Instead, the list is displayed with the commands grouped in a functional order to help you get to the most commonly used information quickly.

The shortcut commands for IPT are listed first. Using these commands takes you to information about IPT and how to use it, to panels for configuring IPT to your personal preferences, and to the latest news about IPT. Next, we find the most commonly used ISPF/IPT commands and the commands that are most immediately helpful. Following these commands are the object list commands and the execute commands.

The two commands that display next to the Commands: label in Figure 5-4, SORT and REFresh, will switch the list to an alphabetically ordered list or return the list to its normal state.

You might find an alphabetically ordered list easier to search than the functionally ordered list. To display the list alphabetically, type SORT on the command line and press Enter. Refer to Figure 5-5 on page 157.

Typing REF on the command line and pressing Enter restores the panel display to its normal configuration, as previously shown in Figure 5-4 on page 156.

## 5.2 IPT syntax definitions

Figure 5-7 shows parts of the **IPT?** panels where the dataset commands are listed. The third column contains shorthand notations that require explanation.

BR	BROWSE	'<DSNpat>(<MEMpat>)'	- BROWSE
ED	EDIT	'<DSNpat>(<MEMpat>)'	- EDIT
VI	VIEW	'<DSNpat>(<MEMpat>)'	- VIEW
BF	BFILE	'<DSNpat>(<MEMpat>)'	- BROWSE VSA
EF	EFILE	'<DSNpat>(<MEMpat>)'	- EDIT VSAM
VF	VFILE	'<DSNpat>(<MEMpat>)'	- VIEW VSAM
O*	SHOW ALL OBJECT-LISTS		
O/	POPULATE NEW OBJECT-LIST		
OH	OHIST	HISTORY LIST OF ACCESSED DATASETS	
OLIS	OLIST	<parm1>,<parm2>	- OBJECT-LIST
OL		<parm1>,<parm2>	- OBJECT-LIST
<hr/>			
OL/	POPULATE NEW OBJECT-LIST		
OLDA	OLDASD	<VOLpat>	- LIST ONLINE DASD VOLUM
OLDD	OLDDNAME	<DDname>	- LIST ALLOCATED
	BASE	<DSNpat>	BASE OF GENERA
<hr/>			
OLS	OLSYS	<SYStype>	- LIST SYSTEM DATASETS

Figure 5-7 Shorthand notations

Refer to Figure 5-7 for these explanations:

- ▶ “pat”: pattern. Explains patterns as seen by IPT
- ▶ “parm”: parameter. Explains parameter as seen by IPT
- ▶ DSNpat: Dataset name pattern. Required by patterns enclosed in apostrophes
- ▶ MEMpat: MEMber name pattern
- ▶ VOL: VOLUME pattern
- ▶ DDname: Data Definition name (from JCL DD statement)
- ▶ SYStype: System type

Using the **IPT?** command shows that various shortcut commands can be used in conjunction with parameters to produce a result with less navigation. We next look at performing a generic search and the capabilities of **IPT?** searches.

## 5.3 Generic searches with dataset patterns

**Note:** Generic pattern searching in IPT is more inclusive than in ISPF.

Generic pattern searches are performed using the wildcard characters asterisk (\*) and percentage symbol (%). If IPT encounters a pattern that fits the standard ISPF pattern syntax, it uses the ISPF generic search. When IPT encounters a nonconforming pattern, it uses its own search method. Use the wildcard characters for these purposes:

- ▶ The asterisk (\*) represents any number of characters.
- ▶ The percentage symbol (%) represents any single character.

**Note:** The wildcard character % in IPT includes dots. Standard ISPF does not include dots.

Figure 5-8 shows a standard ISPF 3.4 dataset pattern search setup.

```
Menu  RefList  RefMode  Utilities  Help

Data Set List Utility

Option ==>

blank Display data set list          P Print data set list
V Display VTOC information          PV Print VTOC information

Enter one or both of the parameters below:
Dsname Level . . . G%%%
Volume serial . . .

Data set list options

Initial View          Enter "/" to select option
1 1. Volume          / Confirm Data Set Delete
2. Space             / Confirm Member Delete
3. Attrib            / Include Additional Qualifiers
4. Total             / Display Catalog Name
                    / Display Total Tracks

When the data set list is displayed, enter either:
"/" on the data set list command field for the command prompt pop-up,
an ISPF line command, the name of a TSO command, CLIST, or REXX exec, or
"=" to execute the previous command.
```

Figure 5-8 Setting up an ISPF generic search

Pressing Enter performs the search. As shown in Figure 5-9 on page 160, only names that begin with “G” and have at least three more characters before the dot are listed.

Figure 5-9 Results of ISPF generic pattern search

To achieve a similar but more extensive search in IPT, you can use the BR command shortcut that includes a generic pattern search. Browse, Edit, and View patterns are interpreted in the following ways (assume the use of the Browse command for the following examples):

- Strings of eight or fewer characters (including the wildcard characters) and without enclosing apostrophes are seen as MEMBER names. The resulting search will be made on the most recently accessed dataset. If this dataset is not a PDS, or a PDS that has no pattern matching members, you will be presented with the Browse – Entry panel. You can then add more detailed information to define your search.
- Strings without enclosing apostrophes that are longer than eight characters (including wildcard characters) or strings without enclosing apostrophes that contain dots will be seen as DATASET NAMES. This type of string will be concatenated with your Time Sharing Option (TSO) ID as a prefix for the name search. If this name is not found, you will be presented with the Browse – Entry panel.
- Strings, regardless of length (including the wildcard characters), enclosed with apostrophes will be seen as DATASET NAMES. The search will be performed as specified. Again, if no dataset name is found, you will be presented with the Browse – Entry panel.

So, BR patterns can be made more general by enclosing them with apostrophes. We will enter the search using them. Figure 5-10 on page 161 shows a BR search using the IPT pattern search capability.

## 5.4 Object List commands

After the basic IPT dataset navigational commands are the 26 Object List (OL) commands. We discuss the OL commands in great detail in other chapters. All of these OL commands are extremely useful in large development environments and large production environments where there are a great number of objects of all kinds.

Two OL commands will be of particular interest to a new user. The first OL command is useful because of its research implications, and the second OL command is useful because of its nature as a persistent memory device.

First, OLDD lists the datasets that are associated with a DDname in order. For example, in Figure 5-21, the OLDD command is issued with no parameters.

```

Menu  Utilities  Compilers  Options  Status  Help
-----
                                ISPF Primary Option Menu
Option ==> oldd

0  Settings      Terminal and user parameters      <  Calendar  >

```

Figure 5-21 OLDD command

Figure 5-22 on page 166 shows the result. You can see by looking at the red oval that a large number of objects have been listed.

```

### 5.5 IPT OL, OLIS, and PLIST commands

PLIST is the former name for what is now the OL/OLIS command. The OL/OLIS command uses the same parameters and behaves the same way as PLIST. PLIST is maintained for the convenience of long time users of IPT.

The syntax for PLIST and OLIS is shown in Figure 5-26 on page 168. The IPT display was reordered using the SORT command.

## 5.6 TSO Permanent commands

The TSO Permanent command-related functions are extremely useful. Entering **IPT?** shows the available IPT TSO-related commands. In Figure 5-27, we have paged to these commands and placed the first one at the top of the panel by using the cursor location scrolling.

-IPT-		COMMAND SHORTCUTS	Row 42 of 55
COMMAND ==>		SCROLL ==> CSR	
Web link: <a href="http://www.ibm.com/software/awdtools/ispfproductivitytool">http://www.ibm.com/software/awdtools/ispfproductivitytool</a>

Figure 5-27 TSO-related shortcuts

Typing the **EX?** command displays the current list of your permanent commands. Previously, we developed a list of commands in the TSO Command Shell to use with this demonstration. Figure 5-28 is the result of executing the **EX?** shortcut.

```

-IPT-                                TSO COMMAND SHELL                                Row 1 of 999
PF6=Standard SPF/TSO, PF10/PF10=Set Linenum
Command ==> _

Enter: TSO command, CLIST, REXX EXEC, or ISPEXEC statement.      Scroll => CSR
/IS standard ISPF/TSO, /H history
/EH edit history, /EP edit permanent, /SAV save, /RES restore
<c><entry number> where <c> is ? or / or omitted.

----- PERMANENT COMMAND LIST -----
1  transmit demomvs.ddds0947 da('DDS0946.DEMO.JCL')              ->
2  pe 'dds0946*' id(xxxx01) acc(read)                             ->
3  x                                                                ->
4  transmit mbgmvsu.greeng da('DDS0945.TEST.SRC')                 ->
5                                                                ->
6  transmit mbgmvsu.greeng da('DDS0946.CLIST')                    ->
7  transmit mbgmvsu.greeng da('DDS0946.DEMO.JCL')                 ->
8  transmit mbgmvsu.greeng da('DDS0946.HFS')                      ->
9  transmit mbgmvsu.greeng da('DDS0946.ISPF.IPITBLIB')            ->
10 transmit mbgmvsu.greeng da('DDS0946.ISPF.ISPPROF')             ->
11 transmit mbgmvsu.greeng da('DDS0946.ISR6567.BACKUP')           ->
12 transmit mbgmvsu.greeng da('DDS0946.SPFLOG1.LIST')              ->
13

```

Figure 5-28 An example of a Permanent Command List

Your command list will differ, of course. Notice that these commands are a number of transmit commands. We did it this way simply to populate the list for this demonstration. You can return to the IPT display by pressing PF3.

Often, when using a TSO command, you find that you need to use a particular command repeatedly. Notice in Figure 5-27 on page 168 that there are EX1 through EX9 commands. You can execute the first through the ninth permanent TSO command in your permanent list simply by entering its same-numbered shortcut. For example, the first command listed in Figure 5-28 is a dataset transmit to another system. Type EX1, and IPT will execute TSO permanent command 1, as shown in Figure 5-29. The result shows in Figure 5-30 on page 170.

```

-IPT-                                COMMAND SHORTCUTS                                Row 39 of 55

```

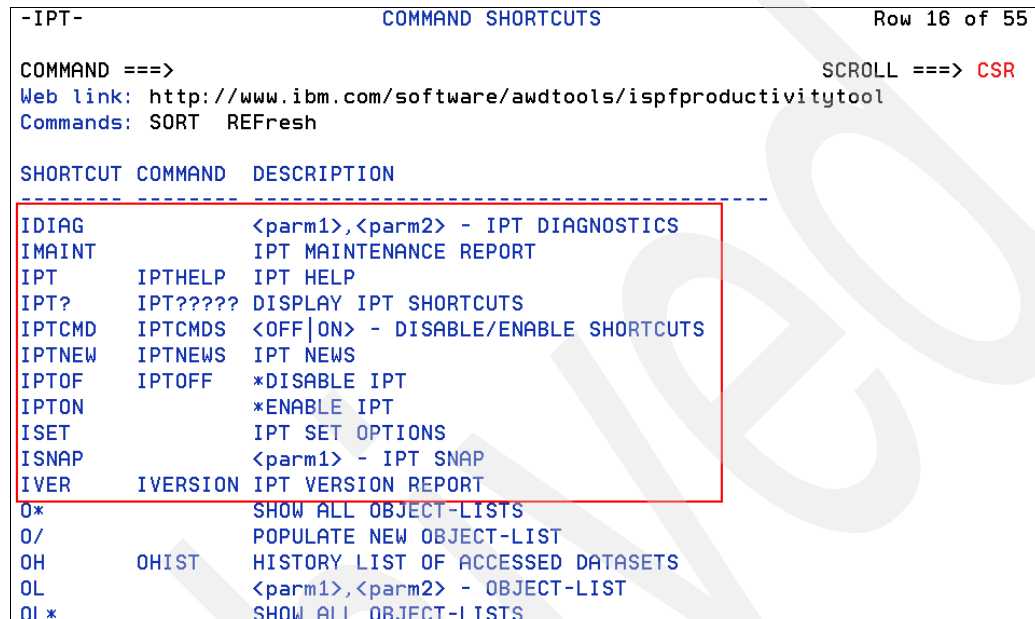

Figure 5-32 The EX= shortcut command result

You will notice that the top entry in the history list is the most recent command. It is also located on the command line, ready to be executed.

## 5.7 IPT-related IPT shortcuts

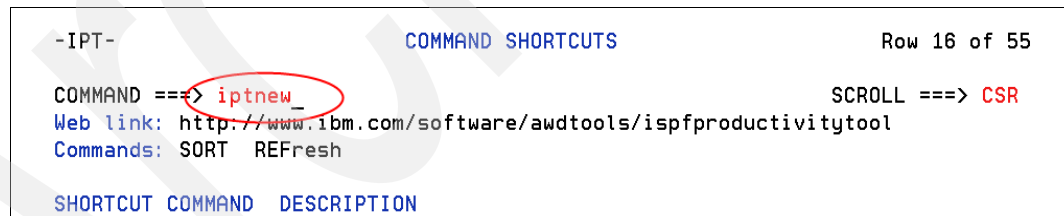

IPT has several shortcut commands related to its use and status. Figure 5-33 shows the IPT panel, which has been reordered using the SORT command. Then, we scroll to the page containing the shortcuts beginning with the letter “I” to group the IPT commands together to see them on one panel.

-IPT-		COMMAND SHORTCUTS	Row 16 of 55
COMMAND ==>		SCROLL ==> CSR

## Invoking IPT from ISPF Option 3.4

IPT is the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS. You are probably quite familiar with the Dataset List Facility, ISPF option 3.4. Option 3.4 is ISPF's main dataset handling tool. IPT has made this option even more useful. The option has been integrated with IPT extended search capabilities and with IPT Object List functionality; therefore, we have the look and feel of ISPF 3.4 with the power of IPT.

The IPT philosophy behind this approach is that every Object List becomes a “launch pad” for action upon any of the objects or any related objects. This simple approach makes it more powerful and easy to use. When you display any list, as with option 3.4 or a direct command, there is a good chance that there is IPT function available to enable you to move directly into the action that you intend to take on the object. If you are unsure as to what those actions are, enter IPT? or A on the command line.

Object Lists, for example, and other IPT features are covered in-depth in other chapters. We do not examine these features here, except as they relate to option 3.4.

## 6.1 IPT Option 3.4 panel changes

Figure 6-1 shows the ISPF Option 3.4 Data Set List Utility.

```
Menu  RefList  RefMode  Utilities  Help
                                     Data Set List Utility

Option ==> _

      blank Display data set list          P Print data set list
        V Display VTOC information        PV Print VTOC information

Enter one or both of the parameters below:
Dsname Level . . .
Volume serial . . .

Data set list options
Initial View
4 1. Volume
  2. Space
  3. Attrib
  4. Total
Enter "/" to select option
/ Confirm Data Set Delete
/ Confirm Member Delete
/ Include Additional Qualifiers
/ Display Catalog Name
/ Display Total Tracks

When the data set list is displayed, enter either:
"/" on the data set list command field for the command prompt pop-up,
an ISPF line command, the name of a TSO command, CLIST, or REXX exec, or
"=" to execute the previous command.
```

Figure 6-1 ISPF Option 3.4 panel

You can retrieve information about datasets or volumes by using various combinations of the dataset list options. The default view is the dataset list.

Figure 6-2 is the IPT enhanced option 3.4 Data Set List Utility panel.

```
Menu  Reflist  Refmode  Special-lists  Utilities  Settings  Test  Help  Exit
IPT- ----- Data Set List Utility -----
Command ==> _
DS - Display dataset list          P - Print data set list
blank - Temporary Object List      PV - Print VTOC information
PL - Permanent Object List         V - Display VTOC information
GDG - Display Generation Datasets  XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
Object List ==>                      (* for selection list, = for DDS0946)
Dsname Level ==>                      More? ==> N
Volume Serial ==>                    (Leave BLANK for catalog scan,
                                      volser or pattern for VTOC scan)

Data set list options:
Initial View ==> 1 : 1. Volume  2. Space  3. Attrib  4. Total
Enter "/" to select option:
/ Confirm Data Set Delete          / Additional Dataset Qualifiers
/ Display Catalog Name            / Display Total Tracks

When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTs, or REXX execs are supported.
```

Figure 6-2 IPT Option 3.4 panel

The immediately noticeable difference is that the panel contains more options and its layout has been altered to accommodate these additional options. It still contains the original ISPF options and parameters. DS is the Display dataset list command, and it behaves as the standard ISPF 3.4 command does when used. Blank is the default list type in Figure 6-2 on page 178, which is the Temporary Object List. PL is your permanent Object List. GDG is the enhanced IPT generation dataset display. P, PV, and V are command options from standard ISPF 3.4. XV is an enhanced volume data display.

**Note:** You can activate all of these commands by either typing a command on the command line, or by moving the cursor to the command and pressing Enter.

Figure 6-3 shows a typed command. In this example, it is a DS command with a generic search. Figure 6-4 on page 180 shows the result.

```

Menu  Kerlist  Kermode  Special-lists  Utilities  Settings  Test  Help  Exit
-IPT- ----- Data Set List Utility -----
Command ==> ds                                     Missing parameters
DS - Display dataset list                          P - Print data set list
blank - Temporary Object List                      PV - Print VTOC information
PL - Permanent Object List                        V - Display VTOC information
GDG - Display Generation Datasets                 XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
Object List ==>                                     (* for selection list, = for MYLIST)
Dsname Level ==> G%*%*                               More? ==> N
Volume Serial ==>                                     (Leave BLANK for catalog scan,
                                                         volser or pattern for VTOC scan)

Data set list options:
Initial View ==> 1 : 1. Volume  2. Space  3. Attrib  4. Total
Enter "/" to select option:
/ Confirm Data Set Delete      / Additional Dataset Qualifiers
/ Display Catalog Name        / Display Total Tracks
When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTs, or REXX execs are supported.

```

Figure 6-6 Results of the cursor-indicated command

Depending on which list command you want to execute (object-related, dataset-related, or volume-related), you must fill in the appropriate information for the command execution in the center part of the panel. This approach is similar to the standard ISPF Option 3.4 action. Figure 6-7 shows the area.

Enter an option or select it by placing cursor on the option code	
Specify parameters below:	
Object List ==>	(* for selection list, = for MYLIST)
Dsname Level ==>	More? ==> N
Volume Serial ==>	(Leave BLANK for catalog scan, volser or pattern for VTDC scan)

Figure 6-7 Additional command information location

We are sure that you have noticed more options and information to the right in Figure 6-7. We will discuss this additional information in detail later.

The bottom part of the panel shows the display control options found in the standard option 3.4. You are, most likely, familiar with these various combinations. For general use, most users have the options set as they are shown in Figure 6-8.

Data set list options:			
Initial View ==> 1 :	1. Volume	2. Space	3. Attrib 4. Total
Enter "/" to select option:			
/ Confirm Data Set Delete	/ Additional Dataset Qualifiers		
/ Display Catalog Name	/ Display Total Tracks		
When the data set list is displayed, enter the "/" line command for a list of the available line commands. TSO commands, CLISTS, or REXX execs are supported.			

Figure 6-8 Display control options

## 6.2 Displaying a Temporary Object List

Blank means perform the default command action. IPT sets the default action to Temporary Object List. You, of course, can change this default command action to your preference. Figure 6-9 shows how blank is displayed on the Option 3.4 panel.

```
Menu Reflist Refmode Special-lists Utilities Settings Test Help Exit
-IPT- ----- Data Set List Utility -----
Command ==>
DS - Display dataset list                P - Print data set list
blank - Temporary Object List            PV - Print VTOC information
PL - Permanent Object List              V - Display VTOC information
GDG - Display Generation Datasets       XV - Extended VTOC & space summary
```

Figure 6-9 Blank specifies the default command

If you consistently use option 3.4 to display a temporary Object List, having that command set as the default action is useful. Then, when using the option, you only need to enter the search criteria to use to produce the list. An example is shown in Figure 6-10 where a temporary object list of objects beginning with G is to be generated.

```
Menu Reflist Refmode Special-lists Utilities Settings Test Help Exit
-IPT- ----- Data Set List Utility -----
Command ==>
DS - Display dataset list                P - Print data set list
blank - Temporary Object List            PV - Print VTOC information
PL - Permanent Object List              V - Display VTOC information
GDG - Display Generation Datasets       XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
Object List ==>                        (* for selection list, = for MYLIST)
Dsname Level ==> G*                    More? ==> N
Volume Serial ==>                     (Leave BLANK for catalog scan,
                                         volser or pattern for VTOC scan)

Data set list options:
Initial View ==> 1 : 1. Volume 2. Space 3. Attrib 4. Total
Enter "/" to select option:
/ Confirm Data Set Delete      / Additional Dataset Qualifiers
/ Display Catalog Name        / Display Total Tracks
When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTS, or REXX execs are supported.
```

Figure 6-10 Default command setup

Notice that no command is entered on the command line in Figure 6-10. Pressing Enter executes the command, and the result is shown in Figure 6-11 on page 183.

Figure 6-13 The OL search result

**Note:** Part of the underlying philosophy of IPT is that a user does not have to change a work habit in order to use IPT.

This philosophy is demonstrated by the ability of a user to perform a search using option 3.4, or to be able to get the same result using an IPT command from anywhere in ISPF. For example, if you were in a program edit session and needed to check on a particular data value before continuing, there is no need to save the work and navigate to ISPF option 3.4, find and access the data, locate the value, and then reverse the process to return to the work. You only need to enter the OL command on the command line in the edit session. We hope that as you become more familiar with IPT, you will begin using the IPT commands directly.

Now, we return to the meaning of blank. Because "BLANK" is intended to indicate your personal default list action, the ability to change it is implied. Changing it is easy to do. To change the "default command," use the IPT SET, or ISET shortcut IPT command. Figure 6-14 on page 185 shows the ISET command entered on the Option 3.4 panel.

```

Menu  Reflist  Refmode  Special-lists  Utilities  Settings  Test  Help  Exit
-IPT- ----- Data Set List Utility -----
Command ==> iset
DS - Display dataset list                P - Print data set list
blank - Temporary Object List            PV - Print VTOC information
PL - Permanent Object List               V - Display VTOC information
GDG - Display Generation Datasets        XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
  Object List   ==>                      (* for selection list, = for MYLIST)
  Dsname Level  ==>                      More? ==> N
  Volume Serial ==>                      (Leave BLANK for catalog scan,
                                          volser or pattern for VTOC scan)

Data set list options:
  Initial View ==> 1 : 1. Volume  2. Space  3. Attrib  4. Total
  Enter "/" to select option:
    / Confirm Data Set Delete      / Additional Dataset Qualifiers
    / Display Catalog Name         / Display Total Tracks
When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTs, or REXX execs are supported.

```

Figure 6-14 ISET command

Pressing Enter executes the command, and Figure 6-15 shows the result. We have circled the DSLIST options, which are of interest to us.

```

-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==>
Select options by number, name, with cursor selection, or with line commands:
Web link: http://www.ibm.com/software/awdtools/ispfproductivitytool
IBMPT is running under ISPF version 5.9

- A - ALL          - Select all the below displayed options
- M - MSL          - Member Selection List options
- O - OLIST        - Object list options
- G - GLOBAL       - Global edit and Findtext options
- P - PRINT        - Print options
s D - DSLIST      - DSLIST options
- T - TSO          - TSO shell options
- E - EDIT         - Edit, Browse and View options
- I - INTERFACE    - Specify user interface options
- N - DIAGNOSE     - Diagnose ISPF errors
- L - LIBRARY      - Persistent table library options
- B - BOOKMGR      - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit

```

Figure 6-15 The ISET panel

You can open the DSLIST options in several ways. You can type the option on the command line as D and press Enter. You can tab to the position in front of the D and either press Enter, or type a character and press Enter. Finally, you can place the cursor anywhere on the line with the D option and press Enter. For emphasis, we have marked the line, as shown in Figure 6-15. Pressing Enter executes the option, and Figure 6-16 on page 186 shows the result.

```
-IPT- -----DSLIS options-----
COMMAND ==>

Specify the action to take when you leave the Command line blank and
press the Enter key:

Default action ==> TP DS=DSLIS
                  TP=Temporary Object List
                  PL=Permanent Object List

Default LEVEL ==>
VOLUME ==>
DSLIS view ==> VOLUME (VOLUME,SPACE,ATTRIB,TOTAL)

VOLUME list threshold ==> 1000 To suppress summary data for speed

Press ENTER for options menu, END to exit, CANCEL for installation defaults.
```

Figure 6-16 DSLIS options

Recall that in Figure 6-9 on page 182, “BLANK” is next to “Temporary Object List,” which is indicated by the circled default action in Figure 6-16. You can change the default action by simply typing the desired default action from the list. You can establish these other defaults:

- ▶ The default name level, which is useful if you consistently access a certain high-level qualifier. The first level must be fully qualified, but lower levels can be specified by wildcard characters.
- ▶ The VOLUME, which is useful if you consistently access information on a volume.
- ▶ The “DSLIS view” option is carried over from the 3.4 panel and can be changed in either location.
- ▶ The “VOLUME list threshold” (set at 1000) means that 1000 volumes can be searched before the search is stopped. In large systems with many volumes, it is essential to limit searches. The IPT initial setting for the threshold is 100. We discuss this option more later.

**Note:** If you know the ISET option that you want to change, you can type the ISET command with that option. The command appears as ISET D.

We change our default list type to DS by typing DS in the field provided and pressing Enter (Figure 6-17 on page 187).

```

-IPT- -----DSLIS options-----
COMMAND ==>

Specify the action to take when you leave the Command line blank and
press the Enter key:

Default action ==> ds DS=DSLIS
                    TP=Temporary Object List
                    PL=Permanent Object List

Default LEVEL ==> -
VOLUME ==> -
DSLIS view ==> VOLUME (VOLUME,SPACE,ATTRIB,TOTAL)

VOLUME list threshold ==> 100 To suppress summary data for speed

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 6-17 Changing to DS

The “Setting IBMIPT Defaults” menu appears, and pressing PF3 returns us to the 3.4 panel. If you had typed the ISET D command, pressing Enter returns you to the 3.4 panel, because there is no intervening panel.

Yet another way to change this default is to place the cursor on the Settings option on the action bar at the top of the 3.4 panel. Figure 6-18 shows the pop-up menu that appears after you place the cursor on the Settings option on the action bar. The current default is marked with an asterisk (\*). You then type the number of the type of list that you want as a default, which, in our case, is 1, and press Enter.

```

Menu Reflist Refmode Special-lists Utilities Settings Test Help Exit
-IPT- ----- Data Set List
Command ==>
  DS - Display dataset list P
blank - Temporary Object List PV
  PL - Permanent Object List V
  GDG - Display Generation Datasets XV

Enter an option or select it by placing cursor
Specify parameters below:
  Object List ==> (* for selection list, = for MYLIST)
  Dsname Level ==> DDS0946%* More? ==> N
  Volume Serial ==> (Leave BLANK for catalog scan,
                    volser or pattern for VTOC scan)

Data set list options:
  Initial View ==> 1 : 1. Volume 2. Space 3. Attrib 4. Total
  Enter "/" to select option:
    / Confirm Data Set Delete / Additional Dataset Qualifiers
    / Display Catalog Name / Display Total Tracks
When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTs, or REXX execs are supported.

```

Figure 6-18 The ISPF action bar settings pop-up menu

The changes made to the defaults by using the ISET command become active when you *next* enter option 3.4. So, if you want them to become active immediately, you must exit and re-enter option 3.4. A change made using Settings from the action bar becomes active when made.

## 6.3 Dataset list (DS) and NON-ISPF generic searches

We have changed our default list type to DS for DSLIST. By using DS as a default, now when a generic search pattern is entered in the Dsname Level field, an ISPF 3.4 type search will be performed. You *cannot* force an IPT search by using a non-conforming generic search pattern.

For example, Figure 6-19 shows option 3.4 with a DS search and a generic search pattern that conforms to ISPF 3.4. Figure 6-20 on page 189 shows the result.

```

Menu Reflist Refmode Special-lists Utilities Settings Test Help Exit
-IPT- ----- Data Set List Utility -----
Command ==>
blank - Display dataset list          P - Print data set list
TP - Temporary Object List           PV - Print VTOC information
PL - Permanent Object List           V - Display VTOC information
GDG - Display Generation Datasets     XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
Object List ==>                      (* for selection list, = for MYLIST)
Dsname Level ==> DDS0946              More? ==> N
Volume Serial ==>                    (Leave BLANK for catalog scan,
                                      volser or pattern for VTOC scan)

Data set list options:
Initial View ==> 1 : 1. Volume 2. Space 3. Attrib 4. Total
Enter "/" to select option:
/ Confirm Data Set Delete           / Additional Dataset Qualifiers
/ Display Catalog Name              / Display Total Tracks

When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTs, or REXX execs are supported.

```

```

Figure 6-22 DS non-conforming search result

The message is due to the % wildcard character in a position where ISPF 3.4 expected to find a blank, a dot, and another dataset level, or an asterisk (\*) wildcard character.

In option 3.4, if you want to employ IPT generic searches, you must enter TP on the command line, because our default command is DS. The other action is to change the default list type tp to TP. Figure 6-23 shows using a TP list type and an IPT generic search pattern. Figure 6-24 on page 191 shows the result.

```

```

Figure 6-28 MORE search result

**Note:** Using an exclamation point (!) in an OLIST, as seen in Figure 6-28, is a comment line.

You can see from Figure 6-28 that both generic searches were performed and the results were displayed in a temporary list. This approach is an obvious advantage over the standard ISPF 3.4 dataset search, which must be done one at a time.

Another way to access and use Multiple Levels lists is by placing your cursor on the **Special-lists** option on the action bar at the top of the option 3.4 panel (shown in Figure 6-29).

```

Menu  Reflist  Refmode  Special-lists  Utilities  Settings  Test  Help  Exit
-----Data Set List Utility-----
Command ==>
blank - Display dataset list                P - Print data set list
  TP - Temporary Object List                PV - Print VTOC information
  PL - Permanent Object List                V - Display VTOC information
  GDG - Display Generation Datasets          XV - Extended VTOC & space summary

```

Figure 6-29 Action bar item Special-lists

Figure 6-30 on page 194 shows the result. The Special-lists pop-up panel appears. Typing number 4 and pressing Enter starts the Multiple Levels function.

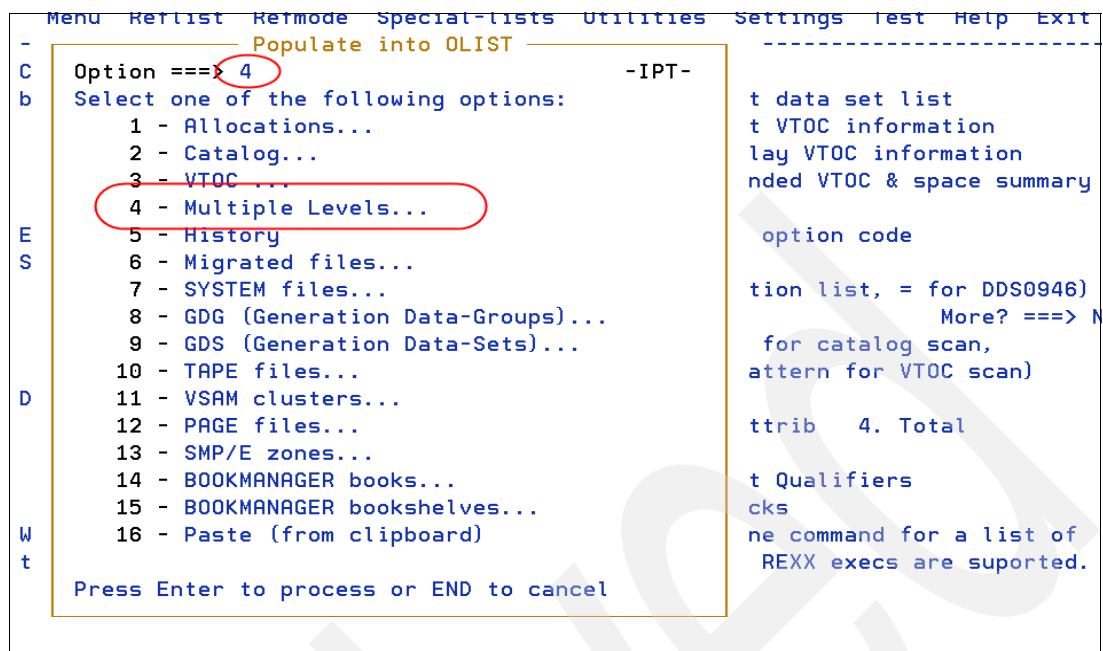

Figure 6-30 Special-Lists pop-up panel

Figure 6-31 shows the Multiple Levels pop-up panel. Notice that the MORE? field is still set to N as this pop-up panel was supplied from the Special-lists option on the action bar.

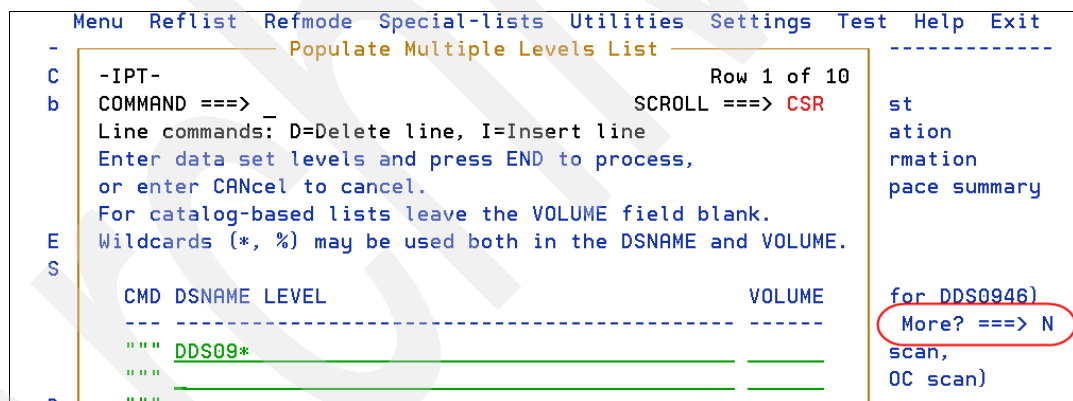

Figure 6-31 The More? field still is N

From this point, executing a multiple level search is the same as setting MORE? to Y.

## 6.5 Additional field panel

An additional field is provided for the TP and PL commands, which invoke IPT functionality. While the TP command can be performed using information from the Dsname Level field, you can enter an Object List name in the Object List field and IPT will prompt you to enter more information.

Typing a Permanent Object List name in the field will display the contents of that Object List. You can then select a member of that list and display its contents. If you have no Permanent

Object Lists and you type the PL command, you will be prompted for a name. See Figure 6-32.

```

Menu  Reflist  Refmode  Special-lists  Utilities  Settings  Test  Help  Exit
-IPT- ----- Data Set List Utility -----
Command ==> PL                                     Enter required field
blank - Display dataset list                        P - Print data set list
TP - Temporary Object List                         PV - Print VTOC information
PL - Permanent Object List                         V - Display VTOC information
GDG - Display Generation Datasets                  XV - Extended VTOC & space summary

Enter an option or select it by placing cursor on the option code
Specify parameters below:
Object List ==> (* for selection list)
Dsname Level ==>                                     More? ==> N
Volume Serial ==>                                     (Leave BLANK for catalog scan,
                                                         volser or pattern for VTOC scan)

Data set list options:
Initial View ==> 1 : 1. Volume 2. Space 3. Attrib 4. Total
Enter "/" to select option:
/ Confirm Data Set Delete      / Additional Dataset Qualifiers
/ Display Catalog Name        / Display Total Tracks
When the data set list is displayed, enter the "/" line command for a list of
the available line commands. TSO commands, CLISTS, or REXX execs are supported.

```

Figure 6-32 PL command with no list name

You can type a name or an asterisk (\*) in the Object List field, and you will be presented with a panel to allow you to enter a name. See Figure 6-33.

```

-IPT-                                     Permanent Object Lists                                     Row 1 of 1
Command ==>                                                                                                                                 Scroll ==> CSR

Your default OLIST is

Line commands: D=Delete, DYN=Dynamic OLIST, IMP=Import, N=Next default, R=Rename
Create a new OLIST by typing over an existing name.

CMD NAME      DESCRIPTION      ENTRIES  CREATED      UPDATED
-----
MYLIST        20 09/02/11 09/02/11 15:18
NEWLIST1      106 09/02/11 09/02/11 15:22
----- END OF LIST -----

```

Figure 6-35 The Permanent Object List

At this point, you can select a list and see its contents.

**Note:** Beware of naming a permanent OLIST with your Time Sharing Option (TSO) PREFIX, which will create a source of confusion. You will want searches for objects beginning with your prefix to yield lists of dataset objects, not the name of an object list.

## 6.6 How to list Generation Data Groups

A new command line feature, as compared to standard ISPF option 3.4, is the Generation Data Group (GDG) command to display of generation data groups. It is true that GDGs can be found and accessed through the regular DS function. However, the new command

handles only GDGs. To use the command, enter the command on the command line and provide a GDG name if you know it or generic search criteria as shown in Figure 6-36.

```

Menu  Reflist  Refmode  Special-lists  Utilities  Settings  Test  Help  Exit

```

Figure 6-37 GDG search result

In Figure 6-37, the red outlined area shows a GDG base name, or group, and three generations of that base. Notice that the base does not have a volume associated with it. In GDG style, the generations are labeled on the left as they are used in the dataset name in JCL. The file named ARCHFILE.TESTING1.G0003V00 and labeled as (0) is the current, or most recent generation, for example.

Using IPT OLG with a parameter achieves the same result as the 3.4 GDG search. You type OLG A\* on *any* command line and press Enter, as shown in Figure 6-38 on page 198.

## 6.7 List files by volumes

Another new feature is XV, compared to standard ISPF option 3.4. Combining the command with Volume Serial search criteria in either a volume name, or a name pattern, retrieves extended DASD information. Figure 6-40 on page 199 shows a volume name search that is ready to execute. Figure 6-41 on page 199 shows the result.

Figure 6-43 XV pattern search result

In Figure 6-43, notice that there are several commands shown above the list of volumes that were retrieved by the search. Most of the commands are obvious in their intent. The SORT command can be performed with several qualifiers. Each letter in the list following the SORT label and separated by the vertical bar (|) relates to a column heading in the display. The relationship is shown in Table 6-1 on page 201.

Table 6-1 Sort letter and relationship

Sort letter	Related column
V	VOLUME
T	TYPE
%	% FREE
F	FREE SPACE
L	LARGEST EXTENT
S	SMS
D	DYN
A	ATTRIBUTES

Assume that we are searching for space for a large dataset. To put the volume with the most space at the top, sort by %, F, or L. An example of a sort using FREE SPACE is shown in Figure 6-44, and the result is shown in Figure 6-45 on page 202.

\*\*\*\*\* Bottom of data \*\*\*\*\*

Figure 6-45 SORT F result

As you can see in Figure 6-45, the volumes with the largest free space are now at the top of the list, and the columns that have been sorted are a different color.

Another convenient way to sort the display to your needs is to use point-and-shoot. Place the cursor on the column that you want to sort and press Enter.

Use the line commands that are listed beneath the main commands to see the volume table of contents (VTOC) for a volume or to see a list of the resident dataset names. Typing S beside DMPA11 and pressing Enter shows you a panel like the panel in Figure 6-41 on page 199. You can view a list of datasets by typing DS next to the volume.

In Figure 6-45, notice the column label \*=EAV. If you are using z/OS V1.10, you can take advantage of Extended Address Volume (EAV) DASD architecture. This architecture allows for bigger volumes by using an expanded addressing scheme. Volumes using the EAV scheme show an asterisk (\*) in the System Managed Storage or SMS column.

Recall from our earlier discussion about setting IPT defaults for DSLIST. We mentioned the Volume List Threshold (see Figure 6-16 on page 186). Although you can change this number to suit your needs, maintain a reasonable number. As you can see from the examples shown, you need to avoid an XV command with only an asterisk (\*) in the Volume Serial field. On a large system, this setup can cause a search that consumes an extensive amount of time and resource. We recommend that you use the smallest number feasible with your system that will produce a quick result.

We have been pointing out as we examine the IPT enhanced option 3.4 that you can easily substitute an appropriate IPT command for the panel and command driven approach to navigation that is common in ISPF. This approach is also true for XV.

To achieve the result that we have seen with the XV command, you can use the OLDA command from *any* command line. Figure 6-46 on page 203 shows the OLDA command with a parameter, and Figure 6-47 on page 203 shows the result.

Figure 6-49 Updated columns

We are sure that you noticed that these columns are all zero, which tells us that there is no space left on this volume. If we take another look at the VTOC information, as Figure 6-50 shows, we can confirm that there is no space left on this volume.

Figure 6-50 100% utilization on this volume

The warning about large searches applies to the OLDA command, as well as to the XV command. The combination OLDA \* will look for *every* volume in the system.

## 6.8 Object List compared to DSLIST volume handling

OLIST looks only for *cataloged* datasets that reside on all volumes, or only datasets that are specified by a volume serial generic pattern.

DSLST displays the VTOC contents of the volumes accessed, which includes *both* cataloged datasets and uncataloged datasets.

Your results will vary with the two searches, because the approaches of DSLIST and OLIST vary to compiling search results. The IPT command OLV uses the same approach as DSLIST and gives the same result.

## 6.9 Populating an Object List

The IBM ISPF Productivity Tool for z/OS User's Guide Version 6 Release 1 Modification 0, SC14-7221, states,

*“The Action Bar contains a new option: Special-lists. When selected, ISPF Productivity Tool will present options that let you open OLISTs containing datasets from special sources, like the allocated datasets, the migrated datasets, and other sources.”*

Earlier in this chapter, we used a special-list option to demonstrate another way to gain access to the Multiple Levels list panel. The specifically tailored approach to object selection lets you get this kind of information quickly. As you can see in Figure 6-51, there are a number of lists available.

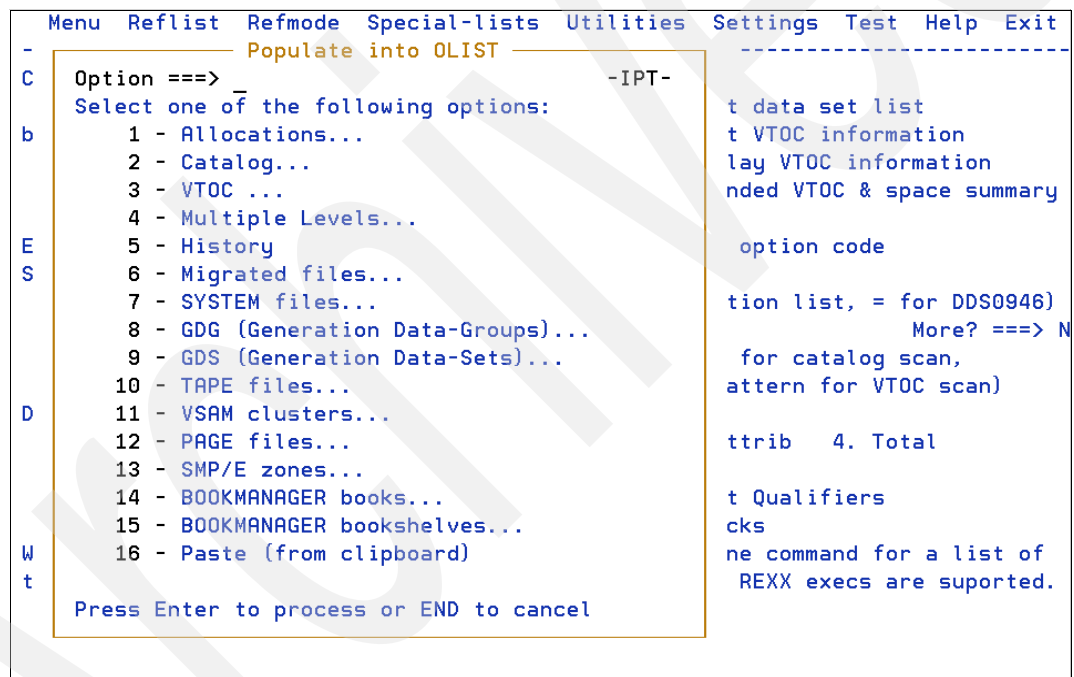

Figure 6-51 Special lists pop-up window

If you take time to explore the Special-lists options, you see that they are panel input versions of IPT commands. These versions are available for users, who prefer this approach. For example, if you type 1, as shown in Figure 6-52, and press Enter, you will see the allocations panel. Figure 6-53 on page 206 shows the resulting input panel.

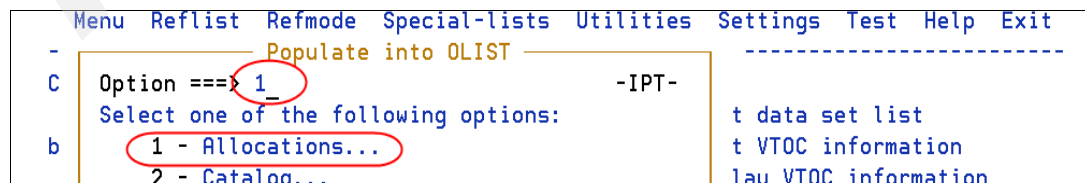

Figure 6-52 Special list 1 access

```
COMMAND ==> -IPT-

DDNAME ==> _ Enter DDNAME or
              BLANK for all allocations

Press ENTER to process or the END key to cancel.
```

Figure 6-53 List 1 input panel

Without typing a DDNAME, we press Enter. Figure 6-54 shows the result.

```

```

Figure 6-54 Resulting OLIST

You can achieve the same result with the IPT command OLDD, which is also true for the other Special Lists.

Use IPT ISPF option 3.4 to enjoy its power and versatility. Hopefully, the IPT capability of being able to use an IPT command from any ISPF command line will, in time, allow you to move beyond option 3.4.

## Enhanced cut and paste

In this chapter, we look at Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS CUT and PASTE commands.

The ISPF Productivity Tool CUT and PASTE commands provide these benefits:

- ▶ ISPF IPT supports up to 200 CUT/PASTE clipboards.
- ▶ Clipboards can be named or numbered. You can edit, browse, copy, save, restore, and rename these clipboards.
- ▶ You have the ability to CUT excluded and non-excluded lines.
- ▶ You can CUT context-sensitive lines by combining the EXCLUDE and FIND commands with the CUT command.
- ▶ Both CUT and PASTE commands support the STATus keyword to display the list of all existing clipboards. You can use this display to select a new or existing clipboard to CUT into or from which to PASTE.
- ▶ You can paste lines from various sources:
  - Previously cut lines
  - Lines from another member
  - Captured output of Time Sharing Option (TSO) commands
  - Member names of a specified directory
  - Contents of a previously cut Object List (OLIST).
- ▶ You can paste lines from the various sources of CUT directly to the printer.

Assistance for the CUT and PASTE commands is available by typing the word CUT or PASTE on the command line of a member (but not in a browse session) and pressing Enter.

## 7.1 Cutting text into a clipboard

To use the CUT command, you must be in a view or an edit session. Using the CUT command, you are able to perform these functions:

- ▶ Cut the entire partitioned dataset or member being edited into a clipboard by specifying the ALL operand. See Figure 7-1 for an example.
- ▶ Cut a part of the partitioned dataset or member being edited into a clipboard by specifying one of these types of information:
  - The labels of the first and last lines that you want copied to the clipboard. See Figure 7-3 on page 210 for an example.
  - The relative line numbers of the first and last lines that you want copied to the clipboard. See Figure 7-4 on page 211 for an example.
  - Use the C, CC, M, or MM editor line commands to specify the lines that you want copied or moved to the clipboard. See Figure 7-5 on page 212 for an example.
  - Specify the NX operand on the CUT command to specify that only the displayed (non-excluded) lines are copied to the clipboard. See Figure 7-8 on page 213 for an example.
  - Use the X operand on the CUT command to specify that only excluded (non-displayed) lines are copied to the clipboard. See Figure 7-10 on page 214 for an example.

Figure 7-1 shows the command that is used to copy the entire member to the default clipboard (00).

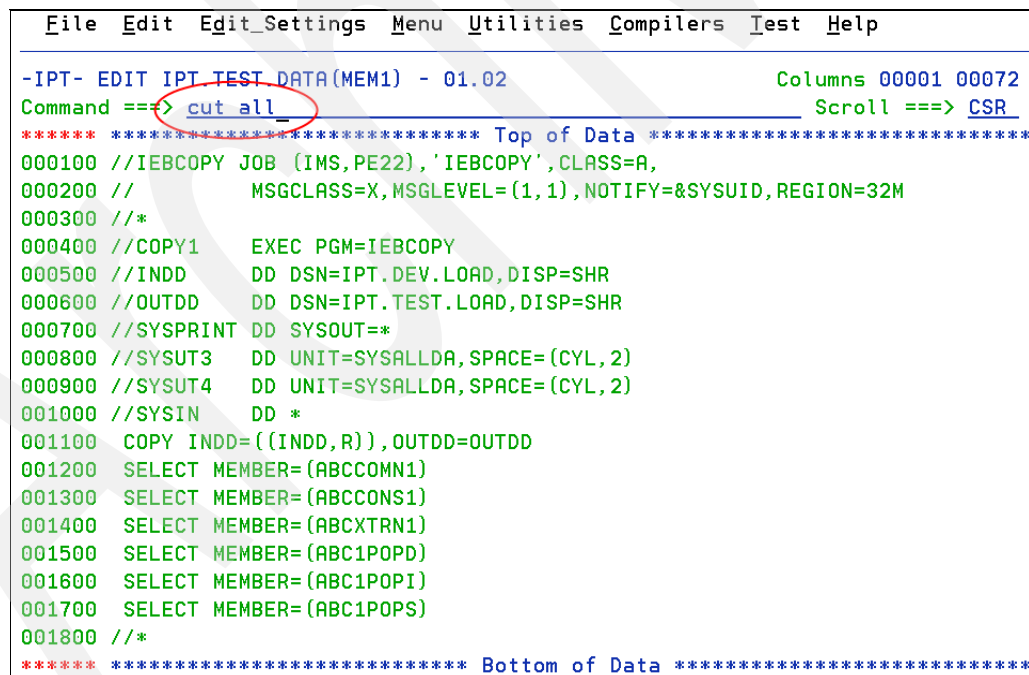

The screenshot shows an ISPF EDIT session window. The title bar at the top contains the menu: File Edit Edit\_Settings Menu Utilities Compilers Test Help. The main window displays the command line: -IPT- EDIT IPT.TEST.DATA(MEM1) - 01.02. Below this, the status bar shows 'Columns 00001 00072' and 'Scroll ==> CSR'. The command line shows 'Command ==> cut all' with 'cut all' circled in red. The data area contains 18 lines of JCL code, starting with '000100 //IEBCOPY JOB (IMS,PE22), 'IEBCOPY',CLASS=A,' and ending with '001800 //\*. The data area is bounded by '\*\*\*\*\* Top of Data \*\*\*\*\*' at the top and '\*\*\*\*\* Bottom of Data \*\*\*\*\*' at the bottom.

Figure 7-1 CUT ALL command

After you have entered the CUT ALL command and pressed Enter, all the lines in the member are copied into the default clipboard (00).

Figure 7-2 on page 209 shows that all 18 lines in the member were copied to the default clipboard (board-0).

```
File Edit Edit_Settings Menu Utilities Compilers Test Help

***** Bottom of Data *****
```

Figure 7-2 Results of the CUT command

## 7.2 Cut using labels

When using the CUT command, you can use labels to specify the start line and the end line of the text to be copied to the clipboard. The lines beginning with the first label and ending with the second label specified on the CUT command will be copied to the clipboard.

Figure 7-3 on page 210 shows a cut of the lines starting at the .a label and ending at the .b label.

```

File Edit Edit_Settings Menu Utilities Compilers Test Help
-IPT- EDIT IPT.TEST.DATA(MEM1) - 01.02 Columns 00001 00072
Command ==> CUT .A .B Scroll ==> CSR

001700 SELECT MEMBER=(ABC1POPS)
001800 /*
***** ***** Bottom of Data *****

```

Figure 7-3 Cut using labels

## 7.3 Cut using relative line numbers

You can use relative line numbers to specify the lines that are to be copied to the clipboard. Specifying the first line number and the last line number on the CUT command causes all lines starting at the first line number and ending with the second line number to be copied to the clipboard.

Figure 7-4 shows a cut of the lines between line 4 and line 11.

```

```

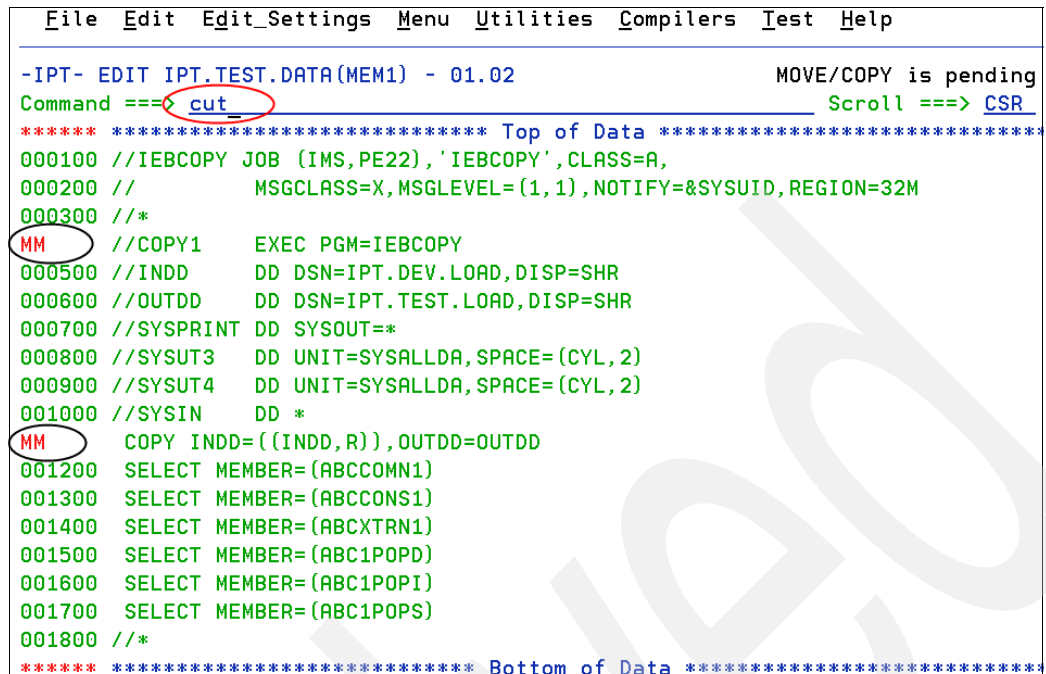

Figure 7-4 CUT command using relative numbers

**Note:** The numbers are the relative line numbers. If lines were deleted or inserted, the relative numbers might not correspond to the numbers down the left side of the member.

## 7.4 Cut using C, CC, M, or MM editor line commands

You can use the C, CC, M, or MM editor line commands to specify the lines that are to be copied or moved to the clipboard. By using the C or CC line commands, the lines will be copied from the member. The M or MM commands will cause the selected lines to be moved to the clipboard and hence deleted from the member.

Figure 7-5 on page 212 shows copying lines using the MM editor commands.

```

Figure 7-6 Results of CUT using MM line commands

## 7.5 Cut using NX or X operands

When editing or viewing a dataset/member, you can exclude lines by using these commands:

- ▶ EXCLUDE/X editor primary command
- ▶ X or XX editor line commands
- ▶ ONLY editor primary command

The CUT command can use the X or NX operand to copy the excluded or not excluded lines.

Figure 7-7 shows issuing the EXCLUDE and FIND primary commands to display only the lines that contain the characters D\$US5.

Figure 7-11 Results of CUT using X operand

## 7.6 Specifying a clipboard on the CUT command

If the TO or STatus operand is not specified on the CUT command, the text is placed in the default (00) clipboard.

You can specify a clipboard into which to copy or move the data by using one of these operands:

- Use the TO operand on the CUT command to specify the clipboard into which the text will be placed. This clipboard will be available until you exit the IPT session unless you specify the SAVE operand to permanently save the clipboard for future IPT sessions.
- Use the STatus operand on the CUT command to display the Active Clipboards panel. By typing an S line command against a clipboard will cause the data to be copied or moved into that clipboard.

Figure 7-12 shows using the TO operand to cut 10 lines of data to the ABC clipboard.

## 7.7 Appending text to an existing clipboard

When using the CUT command, the data in the clipboard will be replaced with the data being copied or moved unless the APPEND operand is used. By using the BEFORE or AFTER operands, you can specify that the data being copied will be appended before or after the existing text.

Figure 7-15 shows cutting 10 lines of data and appending the copied lines after the existing data in the ABC clipboard.

Figure 7-16 Append the text to the beginning of the clipboard

## 7.8 Saving the clipboard for future use

When you leave ISPF, the clipboard will be deleted, unless you specify the SAVE operand on the CUT command when cutting text to a clipboard or unless the clipboard exists and is specified as being permanent (see Figure 7-21 on page 221).

There are two ways that you can make a clipboard permanent so that it can be used in future ISPF sessions:

- ▶ Issue the CUT command with the SAVE operand
- ▶ Issue the CUT STA command, and when you are at the Active Clipboards panel, enter the SAV line command against the clipboards to be saved and made permanent.

Figure 7-17 on page 219 shows using the SAVE operand to make a clipboard permanent and available for future ISPF sessions.

Figure 7-17 Using the CUT command and saving a clipboard for future use

## 7.9 Browsing and editing the clipboard data

You can browse or edit the clipboard data with either of these methods:

- ▶ Use the BROWSE or EDIT operand on the CUT command, which allows the data in the clipboard to be browsed or edited after it has been copied or moved to the clipboard. By using the EDIT operand, the data can be modified prior to being saved to the clipboard.
- ▶ Issue the CUT STA command to view the Active Clipboards panel. From this panel, you can issue a B (Browse) or E (Edit) line command against a clipboard.

Figure 7-18 on page 220 shows using the EDIT operand on the CUT command to edit the data in the clipboard after the data has been copied or moved.

Figure 7-19 Editing the clipboard after issuing the CUT command using the EDIT operand

## 7.10 Displaying and maintaining the current clipboards

To display a list of active clipboards, you can issue either the CUT STATUS or PASTE STATUS command. Either command causes the Active Clipboards panel to be displayed. From the Active Clipboards panel, you can perform these tasks:

- ▶ Browse a clipboard to see what it contains.
- ▶ Copy an existing clipboard to a new or existing clipboard.
- ▶ Delete a clipboard.
- ▶ Edit clipboards to modify the data that is stored in the clipboard.
- ▶ Print the clipboard.
- ▶ Rename a clipboard.

- ▶ Restore a clipboard to its state as of the last save or when you logged on.
- ▶ Save a clipboard so that it is available after you exit ISPF IPT.
- ▶ View the clipboard and possibly select the lines to be pasted.

Figure 7-20 shows issuing the CUT STATUS command to display the Active Clipboards panel.

**Note:** Only temporary (non-persistent) clipboards are deleted when you exit IPT. However, you can choose to make even clipboard 00 a persistent one.

## 7.11 Pasting text from a clipboard

To use the PASTE command, you must be in a view or edit session. You can perform these actions when using the paste command:

- ▶ Paste the contents of a clipboard into the member.
- ▶ Paste the contents of an existing member in the partitioned dataset into the member being viewed or edited.
- ▶ Paste the directory list for a partitioned dataset into the member that is being viewed or edited, which can include the ISPF statistics for each of the members.
- ▶ Paste the output from a TSO command that you enter into the member that is being viewed or edited.
- ▶ Paste a part of the clipboard by specifying the EDIT/VIEW operand and using the C, CC, M, or MM editor line commands to specify the lines in the clipboard to be copied or moved into the member that is being viewed or edited.
- ▶ Paste the data as a temporary msg or note lines in the member that is being viewed or edited.
- ▶ Print the data that is being copied or moved into the member prior to it being pasted.
- ▶ Use the STAtus operand to display a list of clipboards from which you are able to perform these tasks:
  - Select a clipboard to be pasted.
  - Browse, edit, print, or view the contents of a clipboard.
  - Delete, rename, or restore a clipboard.
  - Save a clipboard for future use.

When issuing the PASTE command, you must specify where to paste the text:

- ▶ Use A (after) or B (before) editor line commands to specify to paste the text either after or before the line that you enter with either the A or B editor line command.
- ▶ Specify the AFTer or BEFore operand and a target on the PASTE command. The target can be one of these values:
  - The target can be an editor label that you have previously set up, for example, .LB1.
  - The target can be a relative line number of the member that is being viewed or edited.
  - .ZF is a special editor label that causes text to be pasted before or after the first line of the member, depending on the AFTer or BEFore operand.
  - .ZL is a special editor label that causes text to be pasted before or after the last line of the member, depending on the AFTer or BEFore operand.
  - .ZCSR is a special editor label that causes text to be pasted after or before the line where the cursor is positioned, depending on the AFTer or BEFore operand.

## 7.12 Paste using A or B editor line commands

When using the CUT command, you can use labels to specify the start line and the end line of the text to be copied.

Figure 7-22 on page 223 shows a paste using the A editor line command to insert the clipboard data after the 2nd line.

```

Clipboard data inserted

Figure 7-23 Results of a paste using an A editor line command

## 7.13 Paste using BEFore or AFter operands

By using the BEFore or AFter operands and a target on the PASTE command, you can specify where to insert the data is to be inserted. The target can be any of these elements:

- ▶ You can specify an editor label that you have previously set up, for example, .LB1.
- ▶ You can specify a relative line number of the member that is being viewed or edited.
- ▶ .ZF is a special editor label that will cause text to be pasted before or after the first line of the member, depending on whether you use the AFter or BEFore operand.
- ▶ .ZL is a special editor label that will cause text to be pasted before or after the last line of the member, depending on whether you use the AFter or BEFore operand.

- .ZCSR is a special editor label that will cause text to be pasted after or before the line where the cursor is positioned, depending on whether you use the AFTer or BEFore operand.

Figure 7-24 shows an editor label of .A being used to insert six lines before this label.

```

```

Figure 7-25 Paste using an AFTer operand and a relative line number of 3

## 7.14 Specifying a clipboard on the PASTE command

If you do not specify the FROM or STatus operand on the PASTE command, the data is copied from the default (00) clipboard.

You can specify a clipboard from which the data will be copied by using one of these operands:

- Use the FROM operand on the PASTE command to specify the clipboard from which the text will be copied.
- Use the STatus operand on the PASTE command to display the Active Clipboards panel. Typing an S line command against a clipboard causes the data to be copied from that clipboard.

Figure 7-26 on page 225 shows pasting the data in clipboard ABC into the current member that is being viewed or edited.

```

Figure 7-28 Paste ACTIVE CLIPBOARD panel

## 7.15 Pasting the contents of a member

You can use the Member operand on the PASTE command to copy all the lines from a member within the current partitioned dataset (PDS) into the current member being viewed or edited.

Figure 7-29 shows pasting the XXX member into the current member that is being viewed or edited.

The screenshot shows the IPT EDIT interface for the dataset IPT.TEST.DATA(MEM3) at position 01.06. The menu bar at the top includes File, Edit, Edit\_Settings, Menu, Utilities, Compilers, Test, and Help. The command line shows '-IPT- EDIT IPT.TEST.DATA(MEM3) - 01.06' and 'Command ==> PASTE Member XXX'. The status bar indicates 'MOVE/COPY is pending' and 'Scroll ==> CSR'. The data area is bounded by 'Top of Data' and 'Bottom of Data' markers. It contains five lines of data: '000100 ---1st line', '000200 ---2nd line', '000300 ---3rd line', '000400 ---4th line', and '000500 ---5th line'. The third line is highlighted with a green dashed border, and the letter 'B' is entered in the left margin next to it.

Figure 7-29 Pasting an entire member

## 7.16 Pasting the directory list of a PDS

The DIR operand on the PASTE command allows you to copy the member directory information for a partitioned dataset (PDS) into your member.

Figure 7-30 shows the PASTE DIR command.

The screenshot shows the IPT EDIT interface for the dataset IPT.TEST.DATA(MEM3) at position 01.06. The menu bar at the top includes File, Edit, Edit\_Settings, Menu, Utilities, Compilers, Test, and Help. The command line shows '-IPT- EDIT IPT.TEST.DATA(MEM3) - 01.06' and 'Command ==> PASTE DIR'. The status bar indicates 'MOVE/COPY is pending' and 'Scroll ==> CSR'. The data area is bounded by 'Top of Data' and 'Bottom of Data' markers. It contains five lines of data: '000100 ---1st line', '000200 ---2nd line', '000300 ---3rd line', '000400 ---4th line', and '000500 ---5th line'. The third line is highlighted with a green dashed border, and the letter 'A' is entered in the left margin next to it.

```
File Edit Edit_Settings Menu Utilities Compilers Test Help
-IPT- EDIT IPT.TEST.DATA(MEM3) - 01.06
Command ==> PASTE DIR

Figure 7-32 Results of the PASTE DIR command

## 7.17 Pasting the output from a TSO command

Using the TSO operand on the PASTE command, you can copy the output from a TSO command, CLIST, or REXX exec into your member.

In the following example, we want to run the LISTDS command to list the IPT.TEST.DATA dataset and copy the results into the member that we are currently editing.

Figure 7-33 on page 228 shows the PASTE TSO command.

```
File Edit Edit_Settings Menu Utilities Compilers Test Help
-IPT- EDIT IPT.TEST.DATA(MEM3) - 01.06                                MOVE/COPY is pending
Command ==> PASTE TSO_                                         Scroll ==> CSR
***** ***** Top of Data *****
000100 ---1st line -----
000200 ---2nd line -----
A ---3rd line -----
000400 ---4th line -----
000500 ---5th line -----
***** ***** Bottom of Data *****
```

Figure 7-33 Paste using the TSO operand

After pressing Enter, the PASTE TSO COMMAND panel is displayed on which you can enter the TSO command, CLIST, or REXX exec that you want to run.

Figure 7-34 shows typing the LISTDS 'IPT.TEST.DATA' command.

```
-IPT----- PASTE TSO COMMAND -----
COMMAND ==>

Enter a TSO command to be pasted:

==> listds 'IPT.TEST.DATA' _

Press ENTER to PASTE the TSO output or F3 to cancel.
```

Figure 7-34 PASTE TSO COMMAND panel

After you press Enter, the command that you have entered is executed and the results are pasted into the member that you are currently viewing or editing.

Figure 7-35 on page 229 show the results of the LISTDS 'IPT.TEST.DATA' command pasted into the member.

```

## 7.19 Editing the clipboard prior to copying it

You can edit the clipboard before you copy it by using the EDIT operand on the PASTE command.

Figure 7-39 shows the EDIT operand used with the PASTE command to copy the clipboard ABC.

```
File Edit Edit_Settings Menu Utilities Compilers Test Help
-IPT- EDIT IPT.TEST.DATA(MEM3) - 01.06                MOVE/COPY is pending
Command ==> PASTE FROM abc EDIT                      Scroll ==> CSR
***** Top of Data *****
000100 ----1st line -----

## 7.21 Printing the clipboard

You can print the clipboard data by using any of these methods:

- ▶ Use the PRINT operand on the CUT command, which causes the data in the clipboard to be printed after the data has been copied or moved to the clipboard.
- ▶ Use the PRINT operand on the PASTE command, which causes the data in the clipboard to be printed before the data has been copied from the clipboard.
- ▶ Issue the CUT STA command to view the Active Clipboards panel. From this panel, you can issue a P line command to print a clipboard.

Figure 7-47 shows using the PRINT operand on the CUT command to print the clipboard data.

## Using IBM File Manager for z/OS with IPT

In this chapter, we look at how File Manager for z/OS works with Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS. You can customize the ISPF Productivity Tool to invoke a VSAM file, DB2 Table Browser, or Editor when you access files from an Object List.

We teach you how to customize IPT to invoke the IBM product, File Manager. We also teach you File Manager commands and how to use a copybook with File Manager.

## 8.1 IBM File Manager Publications

IBM File Manager for z/OS provides four features:

- ▶ File Manager Base
- ▶ File Manager for DB2
- ▶ File Manager for IMS
- ▶ File Manager for CICS

With the current release of the ISPF Productivity Tool, an Object List can invoke only the File Manager Base and DB2 features of the IBM File Manager for z/OS product.

This chapter will help you get started with IPT and File Manager. We do not cover all of the functions that the File Manager provides. For additional information about the File Manager for z/OS products, see the *IBM File Manager for z/OS User's Guide and Reference*, SC19-2495, using the following Web site:

<http://www.ibm.com/software/awdtools/filemanager/library/>

You can also review the User's Guide and Reference for additional information about the File Manager Base.

## 8.2 Customizing IPT to invoke File Manager

Using the File Manager Base and DB2 products in IPT requires the customization of IPT. For more information about the customization process, refer to *Improving Your Productivity with the ISPF Productivity Tool V5.9 on z/OS*, SG24-7587.

You use the IQIWIZRD command to customize the ISPF Productivity Tool to invoke the File Manager from an Object List to process both VSAM and DB2 tables.

The following steps guide you through the customization procedure:

- ▶ Log on to ISPF using a valid IPT LOGON procedure.
- ▶ Type TSO IQIWIZRD on the command line to invoke the IPT Customization Wizard.
- ▶ When prompted, enter the SIQITLIB and SIQIPLIB library names.

Figure 8-1 on page 239 shows entering the TSO IQIWIZRD command and being requested to enter the SIQITLIB and SIQIPLIB library names.

```

Press ENTER to proceed or the END key to return to the initial screen.

```

Figure 8-3 Object Classes selection for VSAM datasets and DB2 tables

After pressing Enter on Figure 8-3, several options panels will be displayed, depending on the options that were selected. When you reach the VSAM dataset panel that is shown in Figure 8-4, select **IBM File Manager for z/OS**.

Figure 8-4 shows selecting File Manager for z/OS to process VSAM datasets from an IPT Object List.

```

----- IBMIPT - Customization Wizard -----
COMMAND ==>
When IBMIPT detects a VSAM data set (in BROWSE, EDIT, VIEW, DSLIST, or object
list), it may use an interface to process it. You may select which kind
of VSAM support you want in your installation, if any. The table below
shows what CLIST will handle the support you have selected.

VSAM interface ==> 2 (Select one of the following options)
Option Invoked VSAM interface                                Interface CLIST
-----
0  None (IBMIPT will not handle VSAM files.) . . . . . Not applicable
1  Installation-written VSAM interface . . . . . IQIVSAM
2  IBM File Manager for z/OS . . . . . IQIFMGR
3  File-Aid VSAM browser/editor (For Version 6 or below) . IQIFAID
4  File-Aid VSAM browser/editor (Version 7.0). . . . . IQIXPRT
5  File-Aid VSAM browser/editor (Version 8.0 or above) . . IQIFAR8
6  Data-Xpert VSAM browser/editor . . . . . IQIXPRT
7  MacKinney ISPF VSAM Utility . . . . . IQIMCKN
8  IBM Ditto/ESA . . . . . IQIDIT
9  Serena STARTOOL . . . . . IQISTOL
10 VSAM RECORD BROWSER (A SAMPLE WORKING INTERFACE) . . . IQIVBRO

NOTES:- Options 2-9 require a third-party product. If such a product uses
LIBDEFS, include the LIBDEF statements in the interface CLIST.

```

Figure 8-4 File Manager for z/OS being selected to process VSAM datasets

After pressing Enter on Figure 8-4, IPT displays a panel on which you can select the product to be used, and browse, edit, or view a DB2 table from the Object List.

Figure 8-5 shows selecting option **9 IBM File Manager/DB2 for z/OS table browser/editor** to process DB2 tables from the IPT Object List.

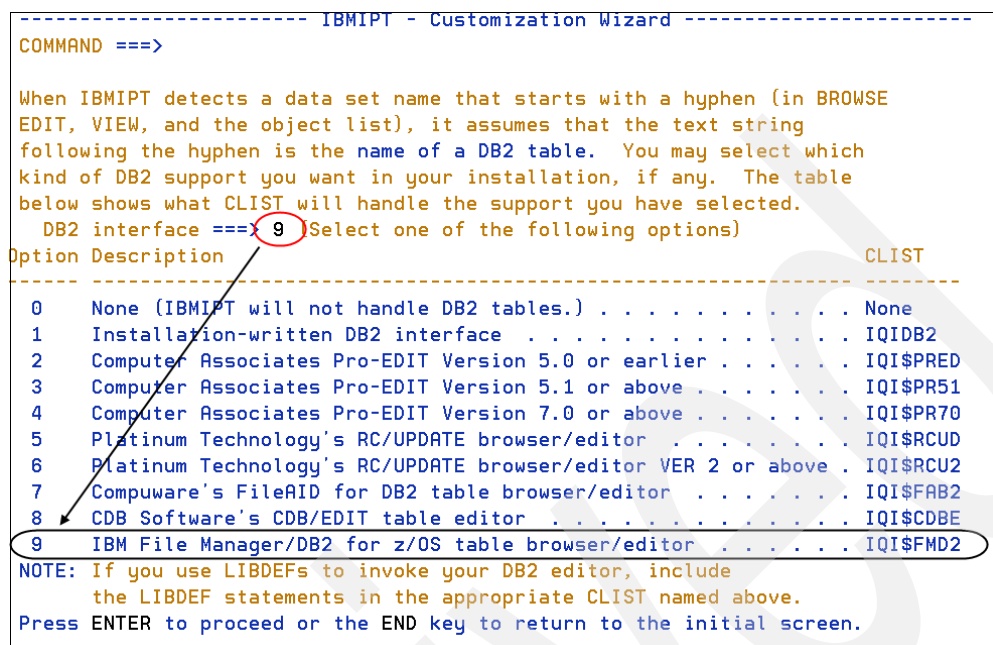

Figure 8-5 File Manager/DB2 for z/OS being selected to process DB2 tables

Complete the IPT Customization Wizard steps.

Now that the IPT customization process is complete, IPT is set up to invoke these routines:

- ▶ IQ\$FMGR CLIST if a VSAM dataset is selected via the IPT Object List.
- ▶ IQ\$FMD2 CLIST if a DB2 object is select via the IPT Object List.

If the ISPF logon procedures being used by users to access IPT have not been modified to allocate the File Manager for z/OS and File Manager/DB2 for z/OS datasets, you need to modify the IQ\$FMGR and IQ\$FMD2 routines to ensure that LIBDEF statements are used to allocate the required File Manager datasets.

## 8.3 Invoking File Manager using LIBDEFS to allocate required datasets

Prior to IPT Release 6.10, it was always necessary to modify the IQ\$FMGR and IQ\$FMD2 CLISTS to allow File Manager Base and DB2 to be invoked. In IPT 6.10, the IQ\$FMGR and IQ\$FMD2 CLISTS were modified as though the File Manager Base and DB2 datasets were allocated by the ISPF logon procedure, and after you have performed the customization described in 8.2, "Customizing IPT to invoke File Manager" on page 238, File Manager Base and DB2 are ready for use.

When editing or viewing a VSAM file or a DB2 table from the Object List if the File Manager Base or DB2 dataset is not allocated, you receive the following messages:

- ▶ 'IKJ56500I COMMAND FILEMGR NOT FOUND' when attempting to edit, browse, or view a VSAM dataset or attempting to access a dataset using File Manager Base.
- ▶ 'IKJ56500I COMMAND FMN2INEX NOT FOUND' when attempting to edit, browse, or view a DB2 table.

If the File Manager Base and DB2 datasets are not allocated, the CLISTS IQI\$FMGR and IQI\$FMD2 will need to be modified to specify the required parameters to allocate the required dataset using LIBDEF statements.

To use LIBDEFs to allocate the File Manager Base datasets, modify the IQI\$FMGR CLIST to specify these values:

- ▶ Modify NOLDEF() to ensure that the LIBDEF statements are used to allocate the File Manager Base datasets.
- ▶ The FMQUAL parameter, which contains the high-level qualifier of the installed File Manager Base datasets. If the sets are in the format FMN.SFMNMOD1, the parameter will be FMQUAL(FMN).
- ▶ The FMOPTS parameter, which contains the load library containing the File Manager Base options module (that is, FMN0POPT) that was set up during the File Manager Base customization.

Figure 8-6 shows the CLIST IQI\$FMGR setup to allocate the File Manager Base datasets using LIBDEFs.

```

```

Figure 8-6 CLIST IQI\$FMGR allocating File Manager Base datasets using LIBDEFs

To use LIBDEFs to allocate the File Manager DB2 datasets, modify the IQI\$FMD2 CLIST to specify these values:

- ▶ Modify NOLDEF() to ensure that the LIBDEF statements are used to allocate the File Manager DB2 datasets.
- ▶ Change the FMQUAL parameter, which contains the high-level qualifier of the installed File Manager DB2 datasets. If the sets are in the format FMN.SFMNMOD1, the parameter will be FMQUAL(FMN).
- ▶ Modify the FMOPTS parameter, which contains the load library containing the File Manager DB2 options module (that is, FMN2POPT) that was set up during the File Manager Base customization.
- ▶ Change the DB2QUAL parameter, which contains the qualifier of the DB2 ISPF panel datasets (that is, DSN.SDSNPFPE and DSN.SDSNSPFP). These datasets are required, because File Manager DB2 invokes DB2 processes, such as SQL Processor Using File Input (SPUFI).

Figure 8-7 shows the CLIST IQI\$FMD2 setup to allocate File Manager DB2 datasets using LIBDEFs.

Figure 8-7 CLIST IQI\$FMD2 allocating File Manager DB2 datasets using LIBDEFs

## 8.4 Using File Manager Base with IPT

After the customization is complete, you can use IPT to invoke File Manager Base from an Object List to browse, edit, or view sequential datasets, partitioned datasets (PDS) or partitioned datasets extended (PDSE), or VSAM datasets.

There are several reasons to invoke the File Manager Base from IPT:

- ▶ VSAM Browse or Edit
- ▶ File is too large to Edit with ISPF.
- ▶ Apply a copybook to File Manager:
  - Visibility to Packed Decimal and Binary fields in readable format

- Table and Single views
- Many more functions
- File Manager supports the following types of VSAM files:
  - Entry Sequence Dataset (ESDS)
  - Key Sequence Dataset (KSDS)
  - Relative Record Dataset (RRDS)
  - Fixed-length or variable-length
  - PATH
  - PATHs that are related to an alternate index are restricted to browse only
  - Alternate Index (AIX®)

Invoking the File Manager Base from IPT shows the object list commands and point-and-shoot main commands (Table 8-1) that can be used to browse, edit, or view sequential datasets, partitioned datasets (PDS or PDSE), or VSAM datasets.

*Table 8-1 Object List commands and point-and-shoot main commands to invoke File Manager Base*

File type	Object List line command	Point-and-Shoot main command	Product invoked
VSAM (all types)	B or V	BR or VI	File Manager – Browse
VSAM (all types)	BF or VF	BF or VF	File Manager – Browse
VSAM (all types)	E or EF	ED or EF	File Manager – Edit
Sequential files	B, V, E	BR, VI, or ED	ISPF – Browse, View, or Edit
Sequential files	BF, VF, or EF	BF, VF, or EF	File Manager browses or edits the file, which is useful if you want to apply a copybook when accessing the file.
Sequential files that are too large for Time Sharing Option (TSO) addressspace memory	V, E	VI or ED	ISPF changes the format to Browse. The file is too large to fit into the TSO Address space memory, so Browse is invoked instead.
Sequential Files too large for TSO addressspace memory	EF	EF	File Manager will edit the file. Because the file will not fit in the TSO Address space, File Manager will use the “Auxiliary Edit” mode to allow you to edit the file.

**Note:** You can use the File Manager to browse or edit sequential files or PDS members. With File Manager, you can apply a copybook to a sequential file, or you can edit a large sequential file that ISPF is unable to edit. Use the BF or EF Object List or Point-and-Shoot command to invoke the File Manager in Browse or Edit mode for sequential files.

Figure 8-8 shows the E line command being issued against a VSAM dataset in the IPT Object List.

Figure 8-9 File Manager Base editing a VSAM dataset

As you can see in Figure 8-9, the VSAM dataset contains non-displayable characters, which are shown as a dot (.). To be able to maintain these characters, you will either need to maintain the data in Hexadecimal mode or use a copybook that maps the data to edit the data in file Manager. We discuss these topics in further detail in 8.4.1, “Maintaining data in hexadecimal mode using File Manager” on page 246 or 8.4.2, “Using copybooks to maintain data using File Manager” on page 247.

## 8.4.1 Maintaining data in hexadecimal mode using File Manager

In File Manager Base, you can view the data in hexadecimal format or in long hexadecimal format.

In hexadecimal mode, File Manager will display three lines for each line in the sequential dataset, PDS, or VSAM dataset. The first line shows the character representation and the second and third lines show the hexadecimal representation of each character. To show data in hexadecimal format in File Manager, either enter the FH primary command or change the Format field on the panel to HEX.

Figure 8-10 shows the data after entering the FH primary command or changing the Format field to HEX.

Figure 8-10 File Manager editing data in hexadecimal format

In long hexadecimal mode, File Manager displays a single line showing the hexadecimal representation. To show data in long hexadecimal format in File Manager, either enter the FL primary command or change the Format field on the panel to LHEX.

Figure 8-11 on page 247 shows the data after entering the FL primary command or changing the Format field to LHEX.

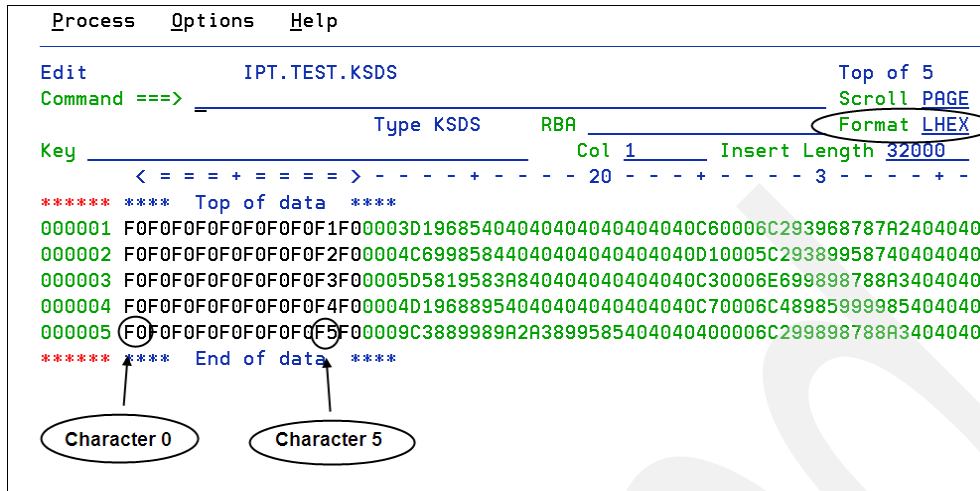

Figure 8-11 File Manager editing data in long hexadecimal format

## 8.4.2 Using copybooks to maintain data using File Manager

Maintaining data in either character, hexadecimal, or long hexadecimal mode can be difficult if the data was created using copybooks with numeric fields. File Manager Base allows you to maintain the data using a copybook that maps the data.

Figure 8-12 shows the copybook EMP, which was used to create the data in the IPT.TEST.KSDS VSAM dataset.

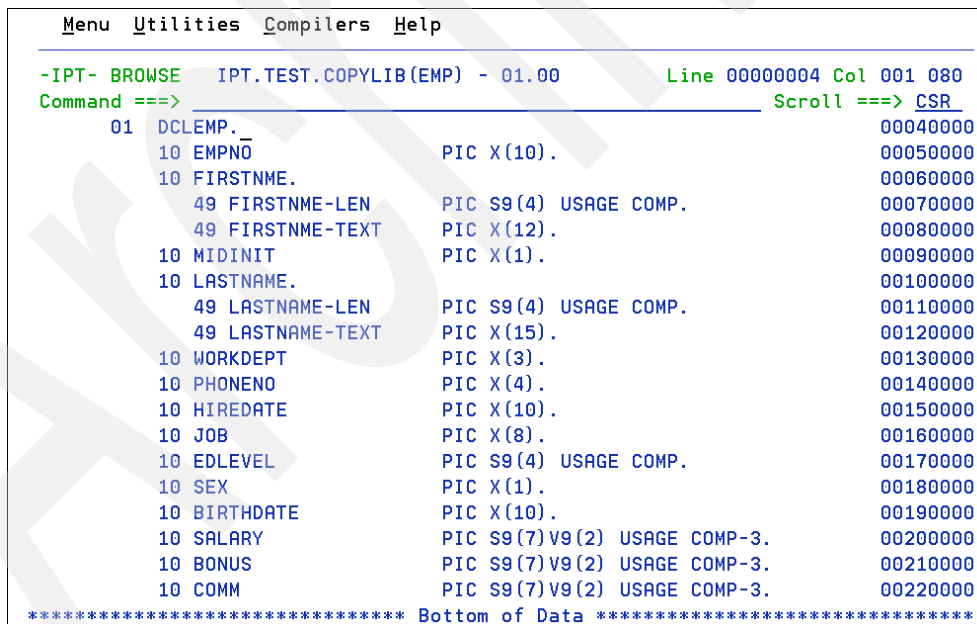

Figure 8-12 COBOL copybook EMP that will be used to map the VSAM data

To run the File Manager Base editor session using a copybook, issue the template edit (TE) primary command by typing TE in the Edit session.

Figure 8-13 on page 248 shows issuing the TE command to run using a copybook.

```

Figure 8-16 File Manager displaying data in SNGL format

To redisplay the data in TABL format, you can issue the FT primary command or change the format field to TABL.

### 8.4.3 Additional features of File Manager Base

File Manager Base has many features (too many to describe here) for browsing, editing, or viewing sequential datasets, PDSs, PDSEs, or VSAM files. For more information about the features that are available, see the *IBM File Manager for z/OS User's Guide and Reference*, using the following Web site:

<http://www.ibm.com/software/awdtools/filemanager/library>

## 8.5 Using File Manager/DB2 with IPT

From an Object List, you can browse, edit, or view a single DB2 table or receive a list of DB2 tables from which you can select a DB2 table to browse, edit, or view.

In the Object List, use the following format to specify a DB2 table:

*subsys\_owner.tabname*

In this format:

- ▶ *subsys* refers to the DB2 subsystem name.
- ▶ *owner* refers to the owner of the DB2 table.
- ▶ *tabname* refers to the name of the DB2 table.

So for example, given a DB2 subsystem of DI11, a table called EDEPT, with an owner of DSN8810, you specify the following entry in the IPT Object List:

DI11\_DSN8810.EDEPT

Also, within the Object List, you can specify a generic name for the DB2 table. For example, if you know that the DB2 owner of the DB2 table starts with DSN, but you do not know the exact owner or name of the table, you specify this format:

DI11\_DSN\*. \*\*

For more information about specifying generic Object List entries, refer to the Chapter 2, "Object Lists" on page 7.

Figure 8-17 shows the DB2TAB Object List with both a single DB2 table entry, as well as a generic DB2 table entry.

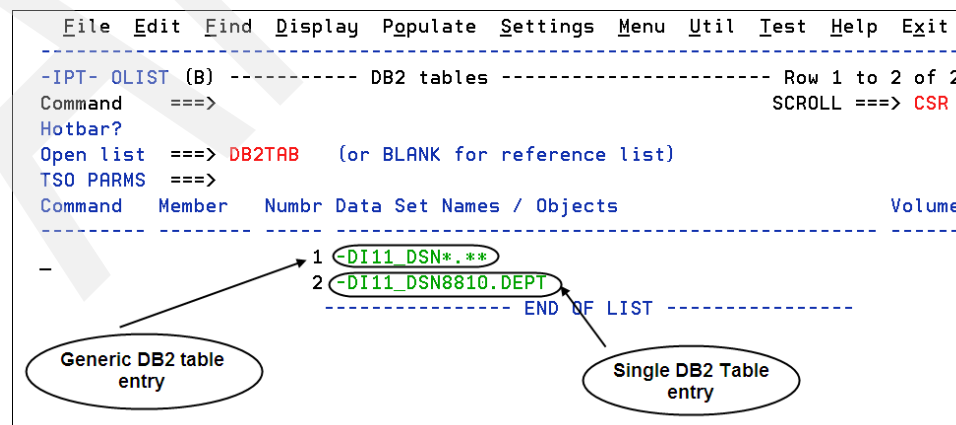

Figure 8-17 Object List showing a single DB2 table entry and a generic DB2 table entry

After File Manager DB2 has been customized to be invoked by IPT, issuing the B (browse), E (edit), or V (view) line commands against a DB2 table entry will invoke File Manager DB2.

## 8.5.1 Browsing, editing, or viewing a fully qualified DB2 table in IPT

By issuing a B (Browse), E (edit), or V (View) line command against a fully qualified DB2 table in the object list will cause File Manager to display the DB2 table automatically.

Figure 8-18 shows issuing a V line command against a fully qualified DB2 table Object List entry.

```

File Edit Find Display Populate Settings Menu Util Test Help Exit
-----
-IPT- OLIST (B) ----- DB2 tables ----- Row 1 to 2 of 2
Command ==> SCROLL ==> CSR

Figure 8-22 File Manager DB2 editing a DB2 table

### 8.5.3 Additional features of File Manager DB2

File Manager DB2 has many features (too many features to describe here) for browsing, editing, or viewing a DB2 table. For more information about the features that are available, see the *IBM File Manager for z/OS User's Guide and Reference for DB2 Data*, SC19-2496, using the following Web address:

<http://www.ibm.com/software/awdtools/filemanager/library/>

Archived

## **IPT customization: First-time logon**

In this chapter, we describe the process of configuring the logon process and using Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS for the first time.

## 9.1 IPT LOGON procedure

The IPT requires a different LOGON procedure. Consult your z/OS system programming team to determine the correct LOGON procedure name to use for the IPT. Specify the LOGON procedure name on the Time Sharing Option (TSO) or TSO/E LOGON panel, as shown in Figure 9-1.

```
----- TSO/E LOGON -----

Enter LOGON parameters below:                                RACF LOGON parameters:

Userid    ==> R00872                                         New Password ==> _
Password  ==>                                              Group Ident  ==>
Procedure ==> IPTBETA
Acct Nmbr ==> ACCT#
Size      ==>
Perform   ==>
Command   ==>

Enter an 'S' before each option desired below:
-Nomail      -Nonnotice    -Reconnect    -OIDcard

PF1/PF13 ==> Help    PF3/PF15 ==> Logoff    PA1 ==> Attention    PA2 ==> Reshow
You may request specific help information by entering a '?' in any entry field
```

Figure 9-1 IPT LOGON procedure

We use the IPT LOGON procedure named IPTBETA. Authorization might be required for the IPTBETA procedure name. The LOGON procedure name is retained until the next time that you log on to ISPF.

## 9.2 IPT persistent tables

IPT maintains a significant number of persistent tables, such as clipboards, Object Lists, Member Selection Lists (MSL) settings, and IPT settings. This data is retained after you log off from ISPF. During your IPT session, most persistent tables are stored in a partitioned data set (PDS) or partitioned data set extended (PDSE) library that is allocated to the DD IPITBLIB.

The IPT customization wizard defines how persistent tables are stored. Persistent tables can be defined during your first logon, pre-allocated by the z/OS system programmer, or not defined.

### 9.2.1 IPT persistent tables defined with first logon

The IPT customization wizard recommends that the allocation of persistent tables occurs during your first logon. If this option is set, you will see the panel that is shown in Figure 9-2 on page 257 when you first log on to IPT.

This panel offers one of three choices:

- ▶ Specify an existing library for persistent tables.
- ▶ Allocate a new library for persistent tables.
- ▶ Operate without a persistent tables library.

```
-IPT----- Persistent Table Management ---- IPITBLIB unavailable
COMMAND ==> _

-IPT- recommends a dedicated library (PDSE) for storing its
persistent tables. DD(IPITBLIB) is currently not allocated or may
be associated with an unusable dataset.
* You may either specify an existing library or dynamically allocate a
new library to be used for this purpose.
* After successfully allocating a valid library, its name is stored in
your profile and will be automatically used from now on, as long as
DD(IPITBLIB) is not explicitly included in your LOGON procedure.
* The library name first suggested by -IPT- is either your permanent
OLIST library (if PDSE), or a cataloged name derived from your
PROFILE library name.
Note: you may choose to operate without saving any -IPT- persistent
tables by declining to allocate DD(IPITBLIB).

Main line commands: D Disable S Select (default)
Press ENTER to process or F3 to cancel.

LIBRARY NAME -> 'R00872.ISPF.IPITBLIB'
```

Figure 9-2 Persistent table management panel

IPT recommends a dedicated PDSE library to store persistent tables. IPT uses the naming convention *userid.ISPF.IPITBLIB* for the DD IPITBLIB allocation. To allocate a PDSE with this naming convention, press Enter. Note that the dataset name type is LIBRARY in Figure 9-3.

```
Menu RefList Utilities Help

Allocate New Data Set

Expiration date . . . (YY/MM/DD, YYYY/MM/DD)
Command ==>
```

Figure 9-3 IPITBLIB allocation

Figure 9-3 on page 257 defines the persistent table library as a PDSE. PDSE libraries have significant benefits. Your installation might require data, such as Management Class or Storage Class. Complete the necessary fields, and press Enter to allocate to the library.

The “IPITBLIB now available” message in Figure 9-4 confirms a successful persistent table library allocation.

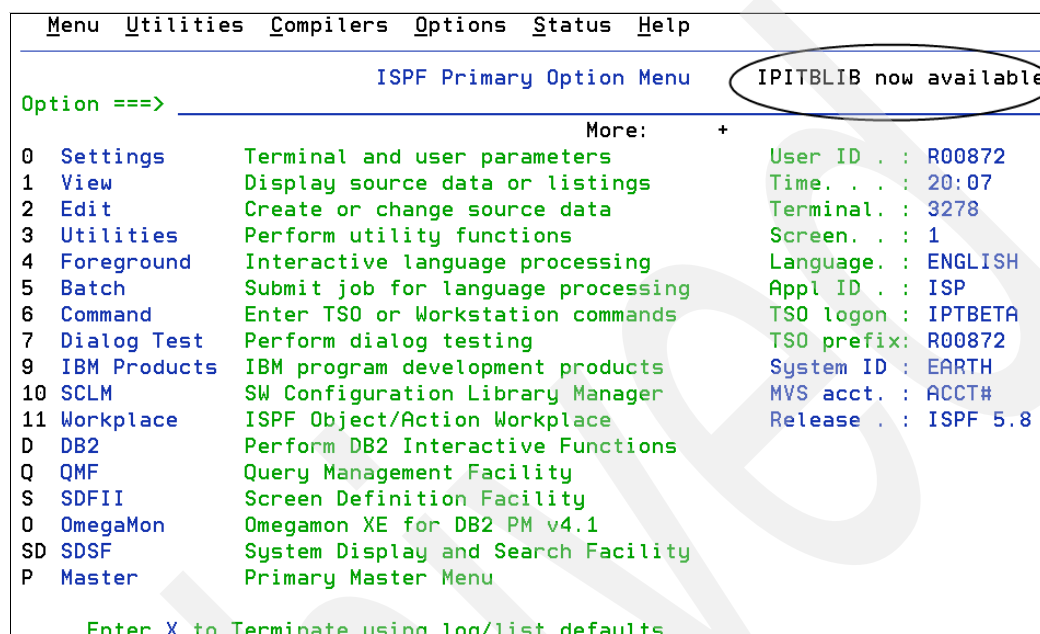

Figure 9-4 IPITBLIB allocation

## 9.2.2 IPT persistent tables defined by the system programmer

The system programmer can predefine your IPT persistent library for you. If this task is completed, no action is required on your part to use all IPT functions.

## 9.2.3 IPT persistent tables defined by user customization

If the Elect Persistent Table Use is set to N during the IPT customization, you might receive a message, such as \*\*\* HISTORY command list not saved. DD(IPITBLIB)unavailable. \*\*\*.

To activate your persistent tables, use the ISET command to invoke IPT defaults as shown in Figure 9-5 on page 259.

```

Figure 9-5 Using ISET to invoke IPT defaults

From the Setting IBMIPT Defaults menu, enter L to navigate to the persistent table library options panel, as shown in Figure 9-6 and Figure 9-7 on page 260.

```

-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==> L_
Select options by number, name, with cursor selection, or with line commands:
IBMIPT is running under ISPF version 5.8

- A - ALL          - Select all the below displayed options
- M - MSL          - Member Selection List options
- O - OLIST        - Object list options
- G - GLOBAL       - Global edit and Findtext options
- P - PRINT        - Print options
- D - DSLIST       - DSLIST options
- T - TSO          - TSO shell options
- E - EDIT         - Edit, Browse and View options
- I - INTERFACE    - Specify user interface options
- N - DIAGNOSE     - Diagnose ISPF errors
- L - LIBRARY      - Persistent table library options
- B - BOOKMGR      - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit

```

Figure 9-6 Selecting IPT persistent table options

Figure 9-7 shows the options for you to choose an action regarding the use of persistent table libraries. We suggest that you choose option A. Option A allocates and enables the use of persistent table libraries while you are logged on to IPT.

```

-IPT- -----Persistent Table Library Options-----
COMMAND ==>

IBM IPT uses DD(IPITBLIB) for specifying a personal library as a
repository of persistent tables, such as CUT/PASTE clipboards and
the TSO-SHELL command lists. This library may be dynamically allocated
or disabled by electing one of the following actions:

A Allocate an existing or a new library for this purpose.

B Backup the current table library and allocate space for a new one.

T Temporarily disable its use for this session. At the next IBM IPT startup
you will be prompted again to elect how to use this facility.

P Permanently disable its use. This facility will be disabled until you
explicitly use the SET command to change this status.

A <== Elect persistent table library action.
Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 9-7 Selecting the option to use persistent table library

We describe the remaining options in detail in Chapter 12, “IPT user customization using the IPT SET command” on page 313.

## Customizing your ISPF keys for Point-and-Shoot

In this chapter, we show you how to effectively use the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS Point-and-Shoot functions.

You can use the standard ISPF function keys to minimize the keystrokes that are required when you use the ISPF Productivity Tool Point-and-Shoot functions. In the following sections, we show you how to define the PF4 key to initiate the VIEW primary command when using System Display and Search Facility (SDSF). You can choose to define a PF key for a Browse or Edit command or any of the ISPF Productivity Tool shortcuts that the **IPT?** command shows. You can choose to define any function key to view the file.

## 10.1 Customizing IPT with View using PF4

Using IPT, you can view a file by typing `VIEW filename` on any primary panel. You can also use the Point-and-Shoot capabilities to identify the file by placing your cursor on the file. If you define a PF key for the VI command, you do not have to type the VIEW command to view the file contents.

ISPF has various KEYLIST files that are used to define function keys for various panels. Defining a VIEW command on one panel might not be applicable to other panels. The VIEW command is useful when viewing printed output using SDSF or when using VIEW from an Member Selection List (MSL) or an Object List (OLIST).

Perform these tasks to define the function key that you want to use:

1. Navigate to the panel where you want to set the PF keys, for example, SDSF.
2. Enter KEYS.
3. Update the PF key command.
4. Optionally, update the PF key label.
5. Exit from the PF Key Definition and Labels panel.

### 10.1.1 Defining PF4 for the IPT View command for SDSF

In this section, we show you how to define a PF key to view files with SDSF. Because separate KEYLISTS are used for an Object List and Member Selection Lists, repeat the following steps when you view the Object List and again when you view a Member Selection List.

Figure 10-1 depicts a job in the SDSF output queue.

## 10.4 Invoking z/OS UNIX Object names using Point-and-Shoot

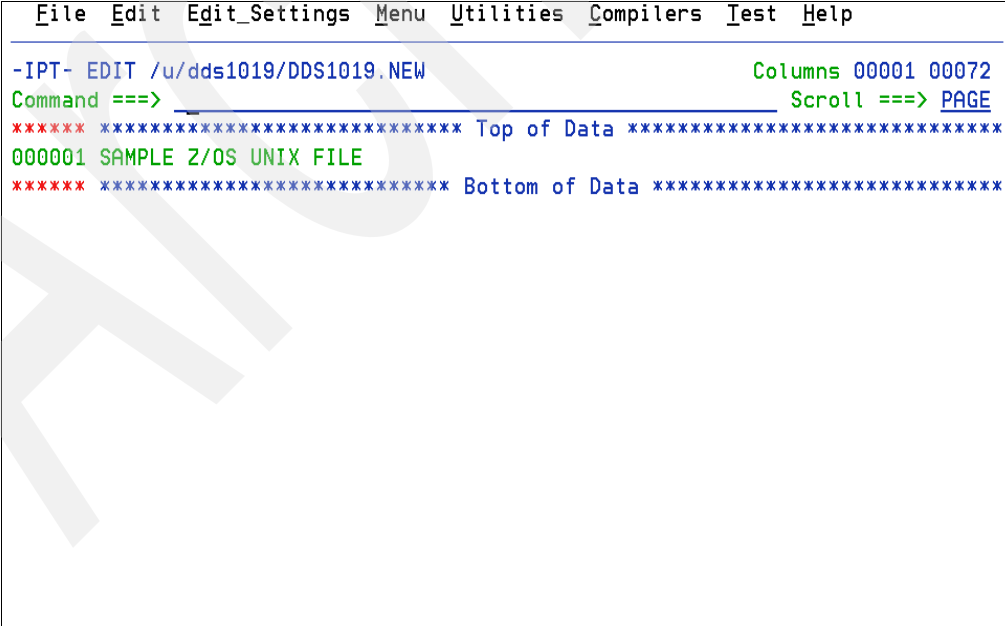

In this section, PF4 invokes the EDIT command. Keep the cursor under the z/OS UNIX file name DDS1019.NEW and press PF4 to invoke the EDIT command, as shown in Figure 10-15.

The screenshot shows the ISPF Point-and-Shoot menu. At the top, there is a menu bar with options: File, Edit, Edit\_Settings, Menu, Utilities, Compilers, Test, Help. Below this, the command line reads: -IPT- EDIT DDS1019.MASTER.DATA(\$UNIX) - 01.00. To the right, it says Columns 00001 00072. Below the command line, there is a line: Command ==> followed by a blank space and Scroll ==> PAGE. The main area of the screen displays a list of data members. The first member is 000100 MEMBER CREATED TO STORE ALL Z/OS UNIX FILE NAMES. The second member is 000200 ./DDS1019.NEW, which is circled in red. Below it are several other members: 000300 ./DDS1019.CUSTOMER, 000400 ./DDS1019.EMPLOYEE, 000500 ./DDS1019.PRODUCT, 000600 ./DDS1019.SERIAL, and 000700 ./DDS1019.DEVICE. At the bottom of the screen, there is a row of function keys: F1=Help, F2=Split, F3=Exit, F4=EDIT (circled in red), F5=Rfind, F6=Rchan, F7=Up, F8=Down, F9=Swap, F10=Left, F11=Right, and F12=Cancel. A red circle is also drawn around the F4 key on the right side of the screen.

Figure 10-15 Invoking a UNIX file for Edit using Point-and-Shoot

The UNIX file is opened for Edit, as shown in Figure 10-16.

The screenshot shows the ISPF Edit command line. At the top, there is a menu bar with options: File, Edit, Edit\_Settings, Menu, Utilities, Compilers, Test, Help. Below this, the command line reads: -IPT- EDIT /u/dds1019/DDS1019.NEW. To the right, it says Columns 00001 00072. Below the command line, there is a line: Command ==> followed by a blank space and Scroll ==> PAGE. The main area of the screen displays a list of data members. The first member is 000001 SAMPLE Z/OS UNIX FILE. Below it are several other members: 000100 MEMBER CREATED TO STORE ALL Z/OS UNIX FILE NAMES, 000200 ./DDS1019.NEW, 000300 ./DDS1019.CUSTOMER, 000400 ./DDS1019.EMPLOYEE, 000500 ./DDS1019.PRODUCT, 000600 ./DDS1019.SERIAL, and 000700 ./DDS1019.DEVICE. At the bottom of the screen, there is a row of function keys: F1=Help, F2=Split, F3=Exit, F4=EDIT, F5=Rfind, F6=Rchan, F7=Up, F8=Down, F9=Swap, F10=Left, F11=Right, and F12=Cancel.

Figure 10-18 System symbols and their values

The System symbol &SYSR1 is defined with the value of DMPRES. The DMPRES is the disk volume on which the datasets reside. You can display the Volume Table of Contents (VTOC) that provides a way of locating the datasets that reside on the DMPRES disk volume. Type the command OLV on the main command line, position the cursor on the System symbol &SYSR1, and then press Enter, as illustrated in Figure 10-19.

```

## Installing IPT V6.1 on z/OS

In this chapter, we describe the installation procedures for Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS on the z/OS environment.

IBM delivers IPT V6.1 in tapes as a custom-built product delivery offering (CDBPO) to you at the address that was specified during the ordering process.

## 11.1 Installation requirements for IPT V6.1

Figure 11-1 shows the beginning of our IPT installation.

Figure 11-1 Installation

The operating system z/OS Version 1 Release 7 or later is the system software required for the installation and operation of IPT Version 6 Release 1.

Installing IPT does not require an IPL or authorized mode. While you invoke IPT, it uses the libraries to which the Time Sharing Option (TSO) LOGON procedure or the CLIST point.

Therefore, we can install IPT on a system-wide basis or only for selected programmers. The IPT code is fully reentrant. Most of the IPT code resides above the 16 MB line. Mostly, IPT acquires working storage above the 16 MB line.

## 11.2 Contents of the IPT product package

In this section, we describe the contents of the IPT product package.

### 11.2.1 Custom-built product delivery offering tapes

A custom-built product delivery offering (CBPDO) tape is usually for a particular feature (CICS, database system, MVS, or NCP). These features correspond to the SRELs to which products are applicable. A CBPDO tape contains the PTFs, HOLDDATA, and preventive

service planning (PSP) upgrade files to bring your system up to a service level that you select.

The CBPDO tape is a standard label (SL) tape, with files arranged in the format that is shown in Table 11-1.

Table 11-1 *Format of a CBPDO tape*

File number	Processed by SMP/E	Contents
	No	Documents
	No	Installation RDBMS Interface Module (RIMs)
	Yes	HOLDDATA for exception SYSMODs
	No	Program directories and PSP information
	Yes	SMPMCS file (MCS statements for SYSMODs on the tape), PTFs, and cover letters
6 – 14	Yes	Relative files (RELFILES) for products on the tape

CBPDO contains a product and services on a single logical tape. It contains the following installation materials:

- ▶ Sample jobs to receive products and service
- ▶ Program directories for the products that you have ordered
- ▶ Installation manuals for the products that you have ordered
- ▶ The IPT V6.1 CDBPO package that is delivered to customer contains these items:
  - Relative file (RELFILE) tape
  - Object code only (OCO)
  - Source code (optional)
- ▶ Program directory (installation manual)

### Relative file tape

A relative file tape, or RELFILE tape, is a standard label tape made up of two or more files. It contains a file of the MCS for one or more functions. It also contains one or more relative files that contain unloaded source datasets and unloaded link-edited datasets that contain executable modules. The relative files might also contain other data, such as sample procedures. These unloaded partitioned datasets (PDSs) are in a format for installation on a z/OS system or subsystem by SMP/E.

The product distribution tape contains the following files in JES2 XMIT format, as shown in Table 11-3 on page 277. The file attributes are the attributes of the resulting files when loaded onto disk. Use the TSO RECEIVE command to process the product distribution tape files.

Table 11-2 Table 11-3 on page 277 Contents of product distribution tape

File	Library
Relative File 1	AIQIINST library: JCL and other members required to install and maintain IPT File name: IBM.HIQI610.F1.XMIT RECFM=FB, LRECL=80, BLKSIZE=8800
Relative File 2	AIQICLIB CLIST library: CLISTs used by IPT in fixed-length format File name: IBM.HIQI610.F2.XMIT RECFM=FB, LRECL=80, BLKSIZE=8800
Relative File 3	AIQICLBV library: same as File 2, but in variable-length format File name: IBM.HIQI610.F3.XMIT RECFM=VB, LRECL=251, BLKSIZE=8785
Relative File 4	AIQILOAD library: IPT load modules for private use File name: File name: IBM.HIQI610.F4.XMIT RECFM=U, LRECL=0, BLKSIZE=6144
Relative File 5	AIQILPA library: IPT load modules for LPA File name: IBM.HIQI610.F5.XMIT RECFM=U, LRECL=0, BLKSIZE=6144
Relative File 6	AIQIMLIB IPT message library File name: IBM.HIQI610.F6.XMIT RECFM=FB, LRECL=80, BLKSIZE=8800
Relative File 7	AIQIPLIB IPT panel library File name: IBM.HIQI610.F7.XMIT RECFM=FB, LRECL=80, BLKSIZE=32720
Relative File 8	AIQISLIB IPT skeleton library File name: IPT.BETA610.SIQISLIB RECFM=FB, LRECL=80, BLKSIZE=8800
Relative File 9	AIQITLIB IPT ISPF table library File name: IPT.BETA610.SIQITLIB RECFM=FB, LRECL=80, BLKSIZE=8800

## Program directory (installation manual)

The program directory (installation manual) is a document that ships with each release of a product. Its primary purpose is to document the installation of the product.

The program directory is part of the informal documentation of the product. It does not contain changes that are unrelated to installation or detailed information that is available in a technical newsletter or replacement publication.

## Contents of the program directory

The program directory model explains what information is to be included in the program directory. The program directory performs the following functions:

- ▶ Describes all of the machine-readable material and publications
- ▶ Documents which systems, concurrent programs, and machines are required
- ▶ Provides details about how to install the product
- ▶ Documents the support that is available for the product
- ▶ Identifies program and service levels to use when communicating with personnel
- ▶ Identifies the resources needed to install the program and the impact of its use on an existing data processing system

## 11.3 IPT installation

You must install and maintain the delivered product code using SMP/E, as described in the Program Directory for IBM IPT V6.1.0, program number 5698-R21, FMID HIQI610. Table 11-3 and Table 11-4 list the target and distribution libraries (datasets) that are used by IPT and their contents.

Table 11-3 *Distribution dataset descriptions*

Library	Description
AIQICLBV	IPT CLIST library (variable blocked)
AIQICLIB	IPT CLIST library (fixed blocked)
AIQIINST	IPT installation and maintenance sample JCL library
AIQILOAD	IPT Linklist load library
AIQILPA	IPT link pack area (LPA) load library
AIQIMLIB	IPT ISPF-message library
AIQIPLIB	IPT ISPF-panel library
AIQISLIB	IPT ISPF-skeleton library
AIQITLIB	IPT ISPF-table library

Table 11-4 *Target dataset descriptions*

Library	Description
SIQICLBV	IPT CLIST library (variable blocked)
SIQICLIB	IPT CLIST library (fixed blocked)
SIQIINST	IPT installation and maintenance sample JCL library
SIQILOAD	IPT Linklist load library
SIQILPA	IPT LPA load library
SIQIMLIB	IPT ISPF-message library
SIQIPLIB	IPT ISPF-panel library
SIQISLIB	IPT ISPF-skeleton library
SIQICLBV	IPT CLIST library (variable blocked)
SIQITLIB	IPT ISPF-table library

### 11.3.1 Sample jobs

Table 11-5 on page 278 shows sample installation jobs that are part of the product. It is useful during the installation of IPT.

Table 11-5 Sample installation jobs

Job name	Job type	Description	RELFILE
IQIJRECV	RECEIVE	Sample RECEIVE job	IBM.HIQI610.F1
IQIJALIB	ALLOCATE	Sample job to allocate target and distribution libraries	IBM.HIQI610.F1
IQIJDDDF	DDDEF	Sample job to define SMP/E DDDEFs	IBM.HIQI610.F1
IQIJAPLY	APPLY	Sample APPLY job	IBM.HIQI610.F1
IQIJACPT	ACCEPT	Sample ACCEPT job	IBM.HIQI610.F1

The mainframe enterprise that we selected has multiple logical partitions (LPARs) running various z/OS releases. We wanted to use the same IPT target libraries on all LPARs, regardless of their z/OS level. The IPT is independent of the z/OS and ISPF release. It dynamically enables or disables any IPT functions that are dependent on certain z/OS or ISPF releases. Consider maintaining a dedicated SMP/E global zone that serves as single point of IPT maintenance for all of the z/OS images of your enterprise, which is called the *IPT single point of maintenance option*.

### To access the sample installation jobs

Follow these steps to access the sample installation jobs:

1. Perform an SMP/E RECEIVE, and then, copy the jobs from the RELFILES to a work dataset for editing and submission. See Table 11-5 to find the appropriate RELFILE dataset.
2. Copy the files numbered 3, 5, and 6-14, which we mentioned in Table 11-1 on page 275, to DASD on the LPAR.
3. The job in Example 11-1 shows the JCL statements to use to copy the contents of RELFILE 1 into DASD. Use either the //TAPEIN or the //FILEIN DD statement, depending on the distribution medium, and comment out or delete the other statement:
  - Add a job card, and change the lowercase parameters to uppercase values to meet your site's requirements before you submit.

Example 11-1 Sample job

---

```
//STEP1      EXEC PGM=IEBCOPY
//SYSPRINT   DD SYSOUT=*
//TAPEIN     DD DSN=IBM.HIQI610.F1,UNIT=tunit
//           VOL=SER=volser,LABEL=(x,SL),
//           DISP=(OLD,KEEP)
//FILEIN     DD DSN=IBM.HIQI610.F1,UNIT=SYSALLDA,DISP=SHR,
//           VOL=SER=filevol
//OUT        DD DSNAME=jcl-library-name,
//           DISP=(NEW,CATLG,DELETE),
//           VOL=SER=dasdvol,UNIT=SYSALLDA,
//           SPACE=(TRK,(5,1,3))
//SYSUT3     DD UNIT=SYSALLDA,SPACE=(CYL,(1,1))
//SYSIN      DD *
              COPY INDD=xxxxIN,OUTDD=OUT
/*
```

---

- If using TAPEIN:
  - *tunit* is the unit value that matches the product tape.
  - *volser* is the volume serial matching the product tape.
  - *x* is the tape file number where the dataset name is on the tape.
  - Refer to the documentation provided by CBPDO to see where IBM.HIQI610.F1 is on the tape.
- If using FILEIN:
  - *filevol* is the volume serial of the DASD device where the downloaded files reside.
- OUT:
  - *jcl-library-name* is the name of the output dataset where the sample jobs are stored.
  - *dasdvol* is the volume serial of the DASD device where the output dataset will reside.
- SYSIN:
  - *xxxxIN* is either TAPEIN or FILEIN depending on your input DD statement.

### 11.3.2 Allocating SMP/E global zone consolidated software inventory libraries

Edit and submit sample job IQIJALIB to allocate the SMP/E target and distribution libraries for the IPT. Consult the instructions in the sample job for more information.

We used the JCL named IQIJALGZ to delete, define, and prime the VSAM files for Global Zone consolidated software inventory (CSI), as shown in Example 11-2.

Example 11-2 JCL IQIJALGZ

---

```
//IQIJALGZ JOB 'ACCOUNT INFORMATION','ALLOC GLOBAL ZONE',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//DELDEF1 EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
DELETE IQI.V6R1M0.GLOBAL.CSI                                /* <==1 */

DEFINE CLUSTER(NAME(IQI.V6R1M0.GLOBAL.CSI)                  /* <==1 */ -
               FREESPACE(20, 5)                             -
               KEYS(24 0)                                    -
               RECORDSIZE(24 143)                           -
               SHAREOPTIONS(2)                               -
               UNIQUE                                         -
               VOLUME(SUPT01))                               /* <==2 */ -
DATA(NAME(IQI.V6R1M0.GLOBAL.CSI.DATA)                      /* <==1 */ -
     CONTROLINTERVALSIZE(4096)                             -
     CYLINDER(10 1))                                         -
INDEX(NAME(IQI.V6R1M0.GLOBAL.CSI.INDEX)                    /* <==1 */ -
      CONTROLINTERVALSIZE(1024)                             -
      TRACK(15 1)                                           -
      IMBED)
/*
//PRIMCSI2 EXEC PGM=IDCAMS
//SMPCSI DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR             /* <==1 */
//ZPOOL DD DSN=SYS1.MACLIB(GIMZPOOL),DISP=SHR
```

```
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
  REPRO OUTFILE(SMPCSI) INFILE(ZPOOL)
//
```

---

Look for the expected return code or message for this job. The job is considered successful if a return code of 0 is received.

### 11.3.3 Allocating SMP/E target and distribution zone libraries

We used the JCL named IQIJALTZ to delete, define, and prime VSAM target and distribution libraries, as shown in Example 11-3.

*Example 11-3 JCL IQIJALTZ*

---

```
//IQIJALTZ JOB 'ACCOUNT INFORMATION','ALLOC TZONE/DZONE',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//DELDEF1 EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
  DELETE IQI.V6R1M0.TZONE.CSI          /* <==1,3 */
  DELETE IQI.V6R1M0.DZONE.CSI          /* <==1,4 */

  DEFINE CLUSTER(NAME(IQI.V6R1M0.TZONE.CSI) /* <==1,3 */ -
    FREESPACE(20, 5)                      -
    KEYS(24 0)                            -
    RECORDSIZE(24 143)                    -
    SHAREOPTIONS(2)                       -
    UNIQUE)                               -
    VOLUME(SUPT01)) /* <==2 */ -
  DATA(NAME(IQI.V6R1M0.TZONE.CSI.DATA) /* <==1,3 */ -
    CONTROLINTERVALSIZE(4096)             -
    CYLINDER(10 1))                      -
  INDEX(NAME(IQI.V6R1M0.TZONE.CSI.INDEX) /* <==1,3 */ -
    CONTROLINTERVALSIZE(1024)             -
    TRACK(15 1)                           -
    IMBED)

  DEFINE CLUSTER(NAME(IQI.V6R1M0.DZONE.CSI) /* <==1,4 */ -
    FREESPACE(20, 5)                      -
    KEYS(24 0)                            -
    RECORDSIZE(24 143)                    -
    SHAREOPTIONS(2)                       -
    UNIQUE)                               -
    VOLUME(SUPT01)) /* <==2 */ -
  DATA(NAME(IQI.V6R1M0.DZONE.CSI.DATA) /* <==1,4 */ -
    CONTROLINTERVALSIZE(4096)             -
    CYLINDER(10 1))                      -
  INDEX(NAME(IQI.V6R1M0.DZONE.CSI.INDEX) /* <==1,4 */ -
    CONTROLINTERVALSIZE(1024)             -
    TRACK(15 1)                           -
    IMBED)

/*
//PRIMCSI2 EXEC PGM=IDCAMS
```

```

//SMPCSI DD DSN=IQI.V6R1M0.TZONE.CSI,DISP=SHR /* <==1,3 */
//ZPOOL DD DSN=SYS1.MACLIB(GIMZPOOL),DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
REPRO OUTFILE(SMPCSI) INFILE(ZPOOL)
/*
//PRIMCSI3 EXEC PGM=IDCAMS
//SMPCSI DD DSN=IQI.V6R1M0.DZONE.CSI,DISP=SHR /* <==1,4 */
//ZPOOL DD DSN=SYS1.MACLIB(GIMZPOOL),DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
REPRO OUTFILE(SMPCSI) INFILE(ZPOOL)
/*
//

```

---

As far as expected return codes and messages, the job is considered successful if a return code of 0 is received.

### 11.3.4 Allocating SMP/E temporary libraries for global zone

We used the JCL named IQIJALSM to allocate the needed SMP/E temporary libraries, while setting up a new global zone for installation and maintenance, as shown in Example 11-4.

*Example 11-4 JCL IQIJALSM*

---

```

//IQIJALTZ JOB 'ACCOUNT INFORMATION','ALLOC TZONE/DZONE',
// CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
// NOTIFY=&SYSUID
//DELDEF1 EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
DELETE IQI.V6R1M0.TZONE.CSI /* <==1,3 */
DELETE IQI.V6R1M0.DZONE.CSI /* <==1,4 */

DEFINE CLUSTER(NAME(IQI.V6R1M0.TZONE.CSI) /* <==1,3 */ -
FREESPACE(20, 5) -
KEYS(24 0) -
RECORDSIZE(24 143) -
SHAREOPTIONS(2) -
UNIQUE) -
VOLUME(SUPT01)) /* <==2 */ -
DATA(NAME(IQI.V6R1M0.TZONE.CSI.DATA) /* <==1,3 */ -
CONTROLINTERVALSIZE(4096) -
CYLINDER(10 1)) -
INDEX(NAME(IQI.V6R1M0.TZONE.CSI.INDEX) /* <==1,3 */ -
CONTROLINTERVALSIZE(1024) -
TRACK(15 1) -
IMBED)

DEFINE CLUSTER(NAME(IQI.V6R1M0.DZONE.CSI) /* <==1,4 */ -
FREESPACE(20, 5) -
KEYS(24 0) -
RECORDSIZE(24 143) -
SHAREOPTIONS(2) -
UNIQUE) -

```

```

        VOLUME(SUPT01))                /* <==2 */ -
DATA(NAME(IQI.V6R1M0.DZONE.CSI.DATA)  /* <==1,4 */ -
      CONTROLINTERVALSIZE(4096)        -
      CYLINDER(10 1))                  -
INDEX(NAME(IQI.V6R1M0.DZONE.CSI.INDEX) /* <==1,4 */ -
      CONTROLINTERVALSIZE(1024)        -
      TRACK(15 1)                      -
      IMBED)

/*
//PRIMCSI2 EXEC PGM=IDCAMS
//SMPCSI DD DSN=IQI.V6R1M0.TZONE.CSI,DISP=SHR /* <==1,3 */
//ZPOOL DD DSN=SYS1.MACLIB(GIMZPOOL),DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
      REPRO OUTFILE(SMPCSI) INFILE(ZPOOL)
/*
//PRIMCSI3 EXEC PGM=IDCAMS
//SMPCSI DD DSN=IQI.V6R1M0.DZONE.CSI,DISP=SHR /* <==1,4 */
//ZPOOL DD DSN=SYS1.MACLIB(GIMZPOOL),DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
      REPRO OUTFILE(SMPCSI) INFILE(ZPOOL)
/*
//

```

---

### 11.3.5 Allocating libraries for target and distribution zones

We used the following JCL named IQIJALIB to allocate files for the target and distribution libraries for the IBM IPT, as shown in Example 11-5.

*Example 11-5 JCL IQIJALIB*

---

```

//IQIJALIB JOB 'ACCOUNT INFORMATION','ALLOCATE LIBS',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//IQIRALOC PROC TGTHLQ=,DSTHLQ=,TUNIT=,DUNIT=,TVOLID1=,TVOLID2=,DVOLID=
//ALLOC EXEC PGM=IEFBRI4
/*
/* ALLOCATE TARGET LIBRARIES
/*
//SIQIINST DD DSN=&TGTHLQ.SIQIINST,
//          UNIT=&TUNIT,
//          VOL=SER=&TVOLID2,
//          SPACE=(TRK,(5,1,3)),
//          DCB=(RECFM=FB,LRECL=80,BLKSIZE=0),
//          DISP=(NEW,CATLG)
/*

### 11.3.6 Defining global, target, and distribution zone options and DDDEF entries

Edit and submit sample job IQIJDEFZ to create DDDEF entries for the SMP/E target and distribution libraries for the IPT. Consult the instructions in the sample job for more information.

We used the JCL named IQIJDEFZ to define the global, target, and distribution zone options to SMP/E, as well as to define the DDDEFs for SMP/E libraries, as shown in Example 11-6.

Example 11-6 JCL IQIJDEFZ

```
//IQIJDEFZ JOB 'ACCOUNT INFORMATION','DEFINE SMP ZONES',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//CZONES1 EXEC PGM=GIMSMP,PARM='DATE=U',REGION=OM
//SMPCSI DD DISP=SHR,DSN=IQI.V6R1M0.GLOBAL.CSI <==1,2
//SMPLOG DD DISP=SHR,DSN=IQI.V6R1M0.SMPLOG <==1
//SMPPTS DD DISP=SHR,DSN=IQI.V6R1M0.SMPPTS <==1
//SMPOUT DD SYSOUT=*
//SMPLIST DD SYSOUT=*
//SMPRPT DD SYSOUT=*
//SMPSNAP DD DUMMY
//SYSUDUMP DD DUMMY
//SMPCNTL DD *

### 11.3.7 Performing SMP/E RECEIVE

If you obtained the IPT as part of a CBPDO, use the RCVPDO job found in the CBPDO RIMLIB dataset to RECEIVE the IPT FMIDs and any service, HOLDDATA, or preventive service planning information included on the CBPDO tape. For more information, refer to the documentation included with the CBPDO.

You can also choose to edit and submit sample job IQIJRECV to perform the SMP/E RECEIVE for the IPT. Consult the instructions in the sample job for more information.

We used the JCL to RECEIVE IPT, as shown in Example 11-8.

Example 11-8 JCL IQIJRECV

---

```
//IQIJRECV JOB 'ACCOUNT INFORMATION','RECEIVE PROD',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//RECEIVE EXEC PGM=GIMSMP,REGION=OM      /* <=== NOTE 2 */
//*
//SMPCSI DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== NOTE 3 */
//*
//*SMPTLIB DD UNIT=SYSALLDA,DISP=OLD,      /* <=== NOTE 4 */
//*          VOL=SER=volser
//*
//SMPPTFIN DD DSN=SMPMCS,UNIT=SYSALLDA,    /* <=== NOTE 5 */
//          VOL=SER=IQI610,DISP=OLD
//*
//SMPLOG DD DSN=IQI.V6R1M0.SMPLOG,DISP=SHR /* <== NOTE 6 */
//SMPPTS DD DSN=IQI.V6R1M0.SMPPTS,DISP=SHR /* <== NOTE 6 */
//*
//*
//SMPCNTL DD *
//          SET BDY(GLOBAL) .

RECEIVE SELECT(HIQI610)
          SYSMODS
          LIST
          .
/*
//
```

---

As far as expected return codes and messages, the job is considered successful if a return code of 0 is received.

### 11.3.8 Performing SMP/E APPLY

Edit and submit sample job IQIJPTAP to perform an SMP/E APPLY CHECK for IPT. Consult the instructions in the sample job for more information.

*To receive the full benefit of the SMP/E Causer SYSMOD Summary Report, do not bypass the following information on the APPLY CHECK: PRE, ID, REQ, and IFREQ. The SMP/E root cause analysis identifies only the cause of ERRORS and not the cause of WARNINGS (SYSMODs that are bypassed are treated as warnings, not errors, by SMP/E).*

We used the JCL to APPLY the IPT, as shown in Example 11-9 on page 296.

#### Example 11-9 JCL IQIJPTAP

---

```
//IQIJPTAP JOB 'ACCOUNT INFORMATION','APPLY PTF',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//APPLY     EXEC PGM=GIMSMP,REGION=OM          /* <=== Note 2 */
//*
//SMPCSI    DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== NOTE 3 */
//SMPLOG     DD DSN=IQI.V6R1M0.SMPLOG,DISP=SHR    /* <=== NOTE 3 */
//SMPLOGA    DD DSN=IQI.V6R1M0.SMPLOGA,DISP=SHR   /* <=== NOTE 3 */
//SMPMTS     DD DSN=IQI.V6R1M0.SMPMTS,DISP=SHR
//SMPSTS     DD DSN=IQI.V6R1M0.SMPSTS,DISP=SHR    /* <=== NOTE 3 */
//SMPPTS     DD DSN=IQI.V6R1M0.SMPPTS,DISP=SHR    /* <=== NOTE 3 */
//SMPSCDS    DD DSN=IQI.V6R1M0.SMPSCDS,DISP=SHR   /* <=== NOTE 3 */
//*
//SMPCNTL   DD *
//          SET BDY(TZONE).                      /* <=== NOTE 4 */
//
//          APPLY SELECT(HIQI610)                 /* <=== NOTE 5 */
//                FORMID(HIQI610)
//                GROUPEXTEND
//          /* CHECK */                           /* <=== Note 6 */
//
//
```

---

As far as the expected return codes and messages from APPLY, the job is considered successful if a return code of 0 is received.

### 11.3.9 Performing SMP/E ACCEPT

Edit and submit the IQIJACPT sample job to perform a SMP/E ACCEPT CHECK for the IPT.

Consult the instructions in the sample job for more information.

*To receive the full benefit of the SMP/E Causer SYSMOD Summary Report, do not bypass the following information on the ACCEPT CHECK: PRE, ID, REQ, and IFREQ. The SMP/E root cause analysis only identifies the cause of ERRORS and not the cause of WARNINGS (SYSMODs that are bypassed are treated as warnings, not errors, by SMP/E).*

Set the ACCJCLIN indicator in the distribution zone before you use SMP/E to load new distribution libraries, which saves the entries that are produced from JCLIN in the distribution zone whenever a SYSMOD that contains inline JCLIN is ACCEPTed. For more information about the ACCJCLIN indicator, see the description of inline JCLIN in the SMP/E manuals.

After you take any of the actions that are indicated by the ACCEPT CHECK, remove the CHECK operand, and run the job again to perform the ACCEPT.

We used the JCL to ACCEPT the IPT, as shown in Example 11-10.

#### Example 11-10 JCL IQIJACPT

---

```
//IQIJACPT JOB 'ACCOUNT INFORMATION','ACCEPT PROD',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//ACCEPT    EXEC PGM=GIMSMP,REGION=OM          /* <=== Note 2 */
//*
```

---

```
//SMPCSI DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== Note 3 */
/*
//SMPCNTL DD *
SET BDY(DZONE) . /* <=== Note 4 */

ACCEPT SELECT(HIQI610)
FORFMID(HIQI610)
GROUPEXTEND
/* CHECK */ /* <=== Note 5 */
.
//
```

---

### Expected return codes and messages from ACCEPT CHECK

If PTFs that contain replacement modules are accepted (ACCEPT step), SMP/E ACCEPT processing will link-edit/bind the modules into the distribution libraries. During this processing, the Linkage Editor or Binder might issue messages that document unresolved external references, which result in a return code of 4 from the ACCEPT step. Ignore these messages. The distribution libraries are not executable, and the unresolved external references do not affect the executable system libraries.

### Expected return codes and messages from ACCEPT

The job is considered successful if a return code of 0 is received.

## 11.3.10 List SYSMODS for IPT

The sample JCL named IQIJLIST can be used to list the SYSMODS for IPT. The JCL is shown in Example 11-11.

*Example 11-11 JCL IQIJLIST*

---

```
//IQIJLIST JOB 'ACCOUNT INFORMATION','LIST SYSMODS',
// CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),

//LIST EXEC PGM=GIMSMP,REGION=OM /* <=== Note 2 */
/*
//SMPCSI DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== Note 3 */
/*
//SMPCNTL DD *
SET BDY(TZONE) . /* <=== Note 4 */

LIST SYSMODS
.
//
```

---

## 11.3.11 Installing PTF for IPT releases

The procedure to RECEIVE, APPLY, and ACCEPT PTF for IPT is similar to installing IPT. The only change required in JCL to process PTF is to replace the parameter for SELECT with the PTF name.

In the case of PTF, there are two additional options: REJECT and RESTORE.

Example 11-12 on page 298 shows the sample JCL named IQIJRJCT for REJECT.

#### Example 11-12 JCL IQIJRJCT

---

```
//IQIJRJCT JOB 'ACCOUNT INFORMATION','REJECT PTF',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID

//REJECT   EXEC PGM=GIMSMP,REGION=OM      /* <=== NOTE 2 */
//*
//SMPCSI   DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== NOTE 3 */
//*
//*SMPTLIB DD UNIT=SYSALLDA,DISP=OLD,      /* <=== NOTE 4 */
//*          VOL=SER=volser
//*
//SMPLOG   DD DSN=IQI.V6R1M0.SMPLOG,DISP=SHR    /* <== NOTE 5 */
//SMPPTS   DD DSN=IQI.V6R1M0.SMPPTS,DISP=SHR    /* <== NOTE 5 */
//*
//SMPCNTL DD *
//          SET BDY(GLOBAL) .

REJECT    SELECT(PTF)                      /* <== NOTE 6 */
          BYPASS(
              APPCHK)
          .
/*
//
```

---

Example 11-13 shows the sample JCL for RESTORE.

#### Example 11-13 RESTORE JCL

---

```
//IQIJRSTR JOB 'ACCOUNT INFORMATION','RESTORE PTF',
//          CLASS=A,MSGCLASS=A,MSGLEVEL=(1,1),
//          NOTIFY=&SYSUID
//RESTORE  EXEC PGM=GIMSMP,REGION=OM      /* <=== Note 2 */
//*
//SMPCSI   DD DSN=IQI.V6R1M0.GLOBAL.CSI,DISP=SHR /* <=== NOTE 3 */
//*
//*SMPTLIB DD UNIT=SYSALLDA,DISP=OLD,      /* <=== NOTE 4 */
//*          VOL=SER=volser
//*
//SMPLOG   DD DSN=IQI.V6R1M0.SMPLOG,DISP=SHR    /* <=== NOTE 5 */
//SMPLOGA  DD DSN=IQI.V6R1M0.SMPLOGA,DISP=SHR    /* <=== NOTE 5 */
//SMPMTS   DD DSN=IQI.V6R1M0.SMPMTS,DISP=SHR    /* <=== NOTE 5 */
//SMPSTS   DD DSN=IQI.V6R1M0.SMPSTS,DISP=SHR    /* <=== NOTE 5 */
//SMPPTS   DD DSN=IQI.V6R1M0.SMPPTS,DISP=SHR    /* <=== NOTE 5 */
//SMPSCDS  DD DSN=IQI.V6R1M0.SMPSCDS,DISP=SHR    /* <=== NOTE 5 */
//*
//SMPCNTL DD *
//          SET BDY(TZONE)                  /* <=== NOTE 6 */
//          OPTIONS(DEFOPT) .

RESTORE   SELECT(PTF)                      /* <=== NOTE 7 */
          GROUP
          .
//
```

---

## 11.4 Customizing the LOGON PROC to invoke IPT

The IPT target libraries, installed above, are ready to be used in any already existing ISPF environment. The only requirement for creating an IPT base environment is to modify an existing TSO LOGON procedure. However, it is better to create a new Time Sharing Option (TSO) LOGON procedure for IPT rather than modify the existing procedure.

We created the new TSO LOGON procedure by copying the existing TSO LOGON procedure for ISPF. The new IPT LOGON procedure is IPTBETA.

Example 11-14 illustrates the changes for you to make to the copy of your LOGON procedure, or you can incorporate the changes into a new LOGON procedure that you create.

*Example 11-14 Logon procedure changes*

```
//*-----
/* SERVERPAC LOGON PROCEDURE
/*
/* THIS PROCEDURE ENABLES USERS TO LOG ON TO TSO/E.
/* THE CLIST ISPBET, WHICH RESIDES IN CPAC.CMDPROC,
/* IS EXECUTED AT FIRST TO INVOKE THE ISPF.
/*-----
//IPTBETA  PROC
//IPTBETA  EXEC PGM=IKJEFT01,DYNAMNBR=500,PARM=ISPBET
//STEPLIB  DD DISP=SHR,DSN=IQI.V6R1M0.SIQILPA
//          DD DISP=SHR,DSN=MQM.SCSQANLE
//          DD DISP=SHR,DSN=MQM.SCSQAUTH
//          DD DSN=QMF.SDSQEXIT,DISP=SHR          * QMF MODULES *
//          DD DSN=QMF.SDSQLOAD,DISP=SHR          * QMF MODULES *
//          DD DSN=SYS1.DSN810.SDSNEXIT,DISP=SHR   * DB2 MODULES *
//          DD DSN=DSN810.SDSNLOAD,DISP=SHR        * DB2 MODULES *
//          DD DSN=GDDM.SADMMOD,DISP=SHR           * GDDM MODULES *
//SYSPROC  DD DISP=SHR,DSN=CPAC.CMDPROC
//          DD DISP=SHR,DSN=IQI.V6R1M0.SIQICLIB
//SYSHELP  DD DISP=SHR,DSN=SYS1.HELP
//          DD DISP=SHR,DSN=ISF.SISFHELP
//          DD DISP=SHR,DSN=SYS1.SBDTHELP
//          DD DISP=SHR,DSN=SYS1.HELPENP
//          DD DISP=SHR,DSN=ISP.SISPHELP
//SYSLBC   DD DISP=SHR,DSN=SYS1.BROADCAST

//SYSIN DD TERM=TS
//*
//*****
//* IPT/IQI DATA SETS *
//*****
//IQITLIB DD DISP=SHR,DSN=IQI.V6R1M0.SIQITLIB

```

---

We created the IPTBETA TSO LOGON procedure as shown in Example 11-15.

### 11.4.1 LPA load library SIQILPA

The IPT target library, SIQILPA, is specified at the first of DD (STEPLIB).

### 11.4.2 CLIST library SIQICLIB

Add the CLIST library to the DD (SYSPROC) concatenation. We recommend that you place the IPT CLIST library as the first library in the concatenation. We created the new CLIST PROC ISPBET and placed it in the CPAC.CMDPROC. PROC name. ISPBET is the parameter to IKJEFT01.

### 11.4.3 Table library SIQITLIB

Add a new statement for the table library with DD (IQITLIB). Do not confuse this DD name with ISPF's ISPTLIB.

Remember that the IPT target libraries must always be ahead of ISPF's SISPLPA and SISPLD.

The new procedure IPTBETA invokes the CLIST ISPIPT. We created the CLIST ISPBET as shown in Figure 11-15.

*Example 11-15 CLIST ISPIPT*

---

```

/*                                     */
/* 5751-CS9                           */
/* (C) COPYRIGHT IBM CORP. 1996, 2006 */
/*                                     */
/* LIB: CPAC.CMDPROC(ISPPDF)          */
/* DOC: THIS CLIST ALLOCATES THE FILES REQUIRED BY ISPF AND PDF */
/*      AND THEN INVOKES PDF.          */
/*                                     */
/* NOTE: SYSPROC IS FREED AND REALLOCATED TO INCLUDE THE PDF CLIST */
/*      DATASET. THIS MAY RESULT IN A DIFFERENT CONCATENATION      */
/*                                     */

```

---

We recommend that you perform the following changes to CLIST ISPNEW before invoking it.

#### 11.4.4 IPT load library SIQILOAD

Place the IPT load library, SIQILOAD, in DD(ISPLLIB) or DD(STEPLIB).

#### 11.4.5 CLIST library SIQICLIB

Add the CLIST library to the DD(SYSPROC) concatenation. We recommend that you place the IPT CLIST library as the first library in the concatenation.

#### 11.4.6 Message library SIQIMLIB

Add the message library to the DD(ISPMLIB) concatenation.

#### 11.4.7 Panel library SIQIPLIB

Add the panel library to the DD(ISPPLIB) concatenation. We recommend that you place the ISPF Productivity Tool panel library as the first library in the concatenation.

#### 11.4.8 Skeleton library SIQISLIB

Add the skeleton library to the DD(ISPSLIB) concatenation.

## 11.5 Creating RACF profile to use the customized TSO LOGON PROC for IPT

To create the RACF profile to use the customized TSO LOGON PROC for IPT:

1. Choose the RACF - Resource Access Control Facility menu from ISPF.
2. Choose option **2** - GENERAL RESOURCE PROFILES from the RACF menu, as shown in Figure 11-2.

```
RACF - SERVICES OPTION MENU
OPTION ==> 2
SELECT ONE OF THE FOLLOWING:
1  DATA SET PROFILES
2  GENERAL RESOURCE PROFILES
3  GROUP PROFILES AND USER-TO-GROUP CONNECTIONS
4  USER PROFILES AND YOUR OWN PASSWORD
5  SYSTEM OPTIONS
6  REMOTE SHARING FACILITY
7  DIGITAL CERTIFICATES, KEY RINGS, AND TOKENS
99  EXIT
Licensed Materials - Property of IBM
5647-A01 (C) Copyright IBM Corp. 1983, 2000
All Rights Reserved - U.S. Government Users
Restricted Rights, Use, Duplication or Disclosure
restricted by GSA ADP Schedule Contract with IBM Corp.
```

Figure 11-2 RACF Services Option Menu

3. Choose option **1**: ADD - Add a profile on the RACF - General Resource Profile Services menu, as shown in Figure 11-3.

```
RACF - GENERAL RESOURCE PROFILE SERVICES
OPTION ==> 1
SELECT ONE OF THE FOLLOWING:
1  ADD          Add a profile
2  CHANGE       Change a profile
3  DELETE       Delete a profile
4  ACCESS       Maintain access list
5  AUDIT        Monitor access attempts (Auditors only)
D or 8  DISPLAY  Display profile contents
S or 9  SEARCH   Search the RACF data base for profiles
```

Figure 11-3 RACF Services options

4. Add the profile information. We specified CLASS as TS0PR0C and PROFILE as IPTBETA, as shown in Figure 11-4.

```

RACF - GENERAL RESOURCE SERVICES - ADD

OPTION ==>

ENTER THE FOLLOWING PROFILE INFORMATION:

CLASS      ==> TSOPROC
PROFILE    ==> IPTBETA

<==end of data

USE A MODEL      ==>      YES or NO

NOTE: Embedded Blanks are NOT ALLOWED in class or profile names.
      The profile name may be case sensitive.  View the help and
      select PROFILE NAME for more detail.

```

Figure 11-4 7 RACF Add profile

5. In Figure 11-5, we have specified the relevant parameters. We recommend that you specify UACC as READ, as shown in Figure 11-5. Press Enter. The profile IPTBETA is ready to use.

```

RACF - ADD GENERAL RESOURCE PROFILE

COMMAND ==>

CLASS:      TSOPROC
PROFILE    _ IPTBETA

ENTER OR CHANGE THE FOLLOWING INFORMATION:

OWNER      ==> AMIT      Userid or group name
LEVEL      ==> 0        0-99
FAILED ACCESSES ==> FAIL  FAIL or WARN
UACC       ==> READ     NONE, READ, UPDATE,
                        CONTROL, ALTER or EXECUTE
AUDIT SUCCESSES ==> NOAUDIT READ, UPDATE, CONTROL,
                        ALTER, or NOAUDIT
AUDIT FAILURES  ==> READ  READ, UPDATE, CONTROL,
                        ALTER, or NOAUDIT
NOTIFY         ==>      Userid

TO ADD OPTIONAL INFORMATION, ENTER YES ==>

```

Figure 11-5 Adding the profile information

## 11.6 Using the new TSO LOGON procedure to invoke IPT

Use the following steps to invoke IPT using the new TSO LOGON procedure:

1. When you log on for the first time using the new IPTBETA procedure, you see the IPT panel, which provides the option to read more about IPT or to continue to the ISPF session, as shown in Figure 11-6.

```
----- TSO/E LOGON -----

Enter LOGON parameters below:                RACF LOGON parameters:

Userid   ==> DDS1019
Password ==>
Procedure ==> IPTBETA
Acct Nmbr ==> ACCT#
Size     ==>
Perform  ==>
Command  ==>

Enter an 'S' before each option desired below:
      -Nomail      -Nonotice      S -Reconnect      -OIDcard
```

Figure 11-6 TSO/E LOGON panel

2. Press Enter to read more about IPT, as shown in Figure 11-7.

```
+----- IBM IPT VERSION 6.1 -----
  ISPF Productivity Tool is installed in this system.  You may:

  * Press the ENTER key to read more about -IPT-.
  * Press the END key to continue with your ISPF session.

  Later, you will be able to display the -IPT- tutorial by entering
  the IPThelp command in the command field of any ISPF panel.
  Likewise, the IPT? main command, will remind you of all -IPT-
  command shortcuts available from any ISPF panel.

The following topics are presented in sequence, or may be selected by number:

1  Introduction                      9  OLIST - Objects List
2  General Commands                 10 MSL - Member Selection List
3  Enhanced EDIT, BROWSE, and VIEW  11 Enhanced TSO Command Support
4  The Point-and-Shoot Interface    12 Enhanced EDIT Commands
5  Data Set History Facility        13 Enhanced BROWSE Commands
6  Access to Data Sets by DD Name   14 The VIEW Facility-EDIT-Comp.Browse
7  Enhanced Data Set List Utility   15 Setting IBMIPT Options
8  Enhanced Printing Facilities     16 IPTHELP-Displaying This Tutorial

SELECTION ==>

```

Figure 11-8 IPT General Information

- When you exit the IPT General Information panel, you see the Persistent Table Management panel, as shown in Figure 11-9. The Persistent Table Management panel indicates that IPITBLIB is unavailable. Press Enter to continue.

```

-IPT----- Persistent Table Management ---- IPITBLIB unavailable
COMMAND ==>

-IPT- recommends a dedicated library (PDSE) for storing its
persistent tables. DD(IPITBLIB) is currently not allocated or may
be associated with an unusable dataset.
* You may either specify an existing library or dynamically allocate a
new library to be used for this purpose.
* After successfully allocating a valid library, its name is stored in
your profile and will be automatically used from now on, as long as
DD(IPITBLIB) is not explicitly included in your LOGON procedure.
* The library name first suggested by -IPT- is either your permanent
OLIST library (if PDSE), or a cataloged name derived from your
PROFILE library name.
Note: you may choose to operate without saving any -IPT- persistent
tables by declining to allocate DD(IPITBLIB).

Main line commands: D Disable S Select (default)
Press ENTER to process or F3 to cancel.

LIBRARY NAME --> 'DDS1019.ISPF.IPITBLIB'

```

Figure 11-9 IPT Persistent Table Management assignment

- Allocate the datasets so that the procedure IPTBETA can use them. Specify the relevant fields, and press Enter to continue, as shown in Figure 11-10 on page 309.

Menu RefList Utilities Help

Figure 11-11 IPITBLIB now available

We can continue to work after IPITBLIB is available.

On every instance after the first logon, when we log on using IPTBETA PROC, the ISPF main menu displays IBM IPT VERSION 6.1, as shown in Figure 11-12 on page 310.

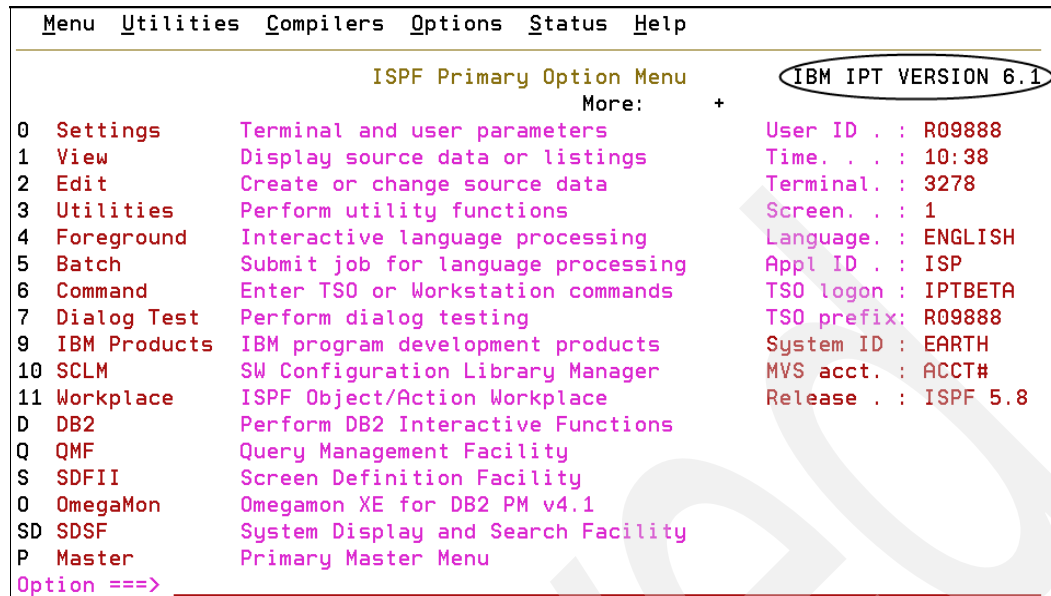

Figure 11-12 IBM IPT Version 6.1 displayed

## 11.7 IPT maintenance

SMP/E controls the maintenance of the IPT. You must periodically review and apply all of the available maintenance, as posted on the IBM IPT Web site at:

<http://www-01.ibm.com/software/awdtools/ispfproductivitytool/support/>

To determine the maintenance level of the IPT at your installation, enter the following command on any IPT panel:

IPT VER or enter the shortcut IVER

The initial panel displays the range of installed APARs, as shown in Figure 11-13 on page 311, which is the IPT VER output. The scrollable list displays the date and maintenance level of each IPT module.

```

## 11.8 Ordering IPT V6.1 for clients in India

In this section, we provide information about the procedure to order IPT V6.1, which is called Shopzseries. Shopzseries is the common way to buy IBM System z® software products. However, Shopzseries is not available for India clients. IPT is a custom-built product delivery offering (CBPDO), product number 5698-R21.

India clients can order IPT V6.1 by calling the IBM help desk for India/SA, which is also known as Shop by phone. The details about the IBM help desk are available at this Web site:

<http://www.ibm.com>

The help desk technician gathers information about the client and the hardware environment in which IPT will be installed.

India clients can also express interest in placing an order using e-mail. Send an e-mail to [inswtech@in.ibm.com](mailto:inswtech@in.ibm.com) asking to purchase IPT V6.1. This Internet e-mail ID is India/SA Techline Support. An India/SA Techline Specialist will respond by e-mail or telephone.

Archived

## **IPT user customization using the IPT SET command**

In this chapter, we describe various options that are available and the process of customizing your Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS user settings. You can set these options to default or modify them as required. The IPT settings cater to various IPT functions, such as Member Selection Lists (MSLs), Object Lists (OLISTs), Time Sharing Option (TSO) Command shell, and so forth. You will find that we have described several of the options for certain functions in other chapters pertaining to the corresponding functions.

## 12.1 Invoke IPT SET menu

The primary menu for setting IPT defaults is invoked by the command IPT SET or ISET as shown in Figure 12-1.

```

```

Figure 12-1 Invoke IPT SET menu

Figure 12-2 shows the menu for setting IPT defaults. As an IPT user, you can set the preference for each of the functions. We describe eleven settings in detail.

```
-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==>
Select options by number, name, with cursor selection, or with line commands:
Web link: http://www.ibm.com/software/awdtools/ispfproductivitytool
IBMIPT is running under ISPF version 5.9

- A - ALL      - Select all the below displayed options
- M - MSL      - Member Selection List options
- O - OLIST     - Object list options
- G - GLOBAL    - Global edit and Findtext options
- P - PRINT     - Print options
- D - DSLIST    - DSLIST options
- T - TSO       - TSO shell options
- E - EDIT      - Edit, Browse and View options
- I - INTERFACE - Specify user interface options
- N - DIAGNOSE  - Diagnose ISPF errors
- L - LIBRARY   - Persistent table library options
- B - BOOKMGR   - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit
```

Figure 12-2 Setting IBMIPT Defaults menu

## 12.2 Using the single option to set ALL IPT defaults

The first option A stands for ALL. By selecting this option, you will be provided with each of the options one after another. We suggest you use this option to review your choices after you have set all of the options.

## 12.3 Settings for Member Selection List (MSL)

Figure 12-3 shows that the MSL setting menu is invoked by typing M. Chapter 3, “Member Selection Lists” on page 91 discusses Member Selection Lists in detail.

```
-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==> M
Select options by number, name, with cursor selection, or with line commands:
IBMIPT is running under ISPF version 5.8

- A - ALL - Select all the below displayed options
- M - MSL - Member Selection List options
- O - OLIST - Object list options
- G - GLOBAL - Global edit and Findtext options
- P - PRINT - Print options
- D - DSLIST - DSLIST options
- T - TSO - TSO shell options
- E - EDIT - Edit, Browse and View options
- I - INTERFACE - Specify user interface options
- N - DIAGNOSE - Diagnose ISPF errors
- L - LIBRARY - Persistent table library options
- B - BOOKMGR - BookManager interface options

Make your selection and press the ENTER key or press the END key to exit
```

Figure 12-3 Invoke MSL setting

Figure 12-4 provides the various options that you can set in the IPT profile for MSLs.

```
-IPT- -----Member Selection List options-----
COMMAND ==>

Automatic preview (with LOCATE/FIND) ==> Y (Y=Yes, N=No)
Replace existing members (COPY/MOVE) ==> O (Y=Yes, N=No, O=Older)
Member list line command pad character ==> (Blank, Dot, Quote, Underscore)
Main menu option 1 default process ==> B (B=Browse, V=View)
Main menu option 1,2 @H display ==> Y (Y=Olist, N=No)
Default cursor position ==> M (M=Main, L=Line cmd)
Include member names in dataset history ==> N (Y=Yes, N=No)
Prompt with FIND command after a Global FIND ==> Y (Y=Yes, N=No)
Double-Byte-Character-Set (DBCS) support ==> N (Y=Yes, N=No)
If DBCS supported, use case-sensitive search strings ==> N

Commands executed by TAILOR command:
==>

Press ENTER for options menu, END to exit, CANCEL for installation defaults.
```

Figure 12-4 MSL options

Table 12-1 on page 316 defines the available options for MSLs.

Table 12-1 MSL settings and descriptions

MSL setting	Description
Automatic preview (with LOCATE/FIND)	You can watch the preview of the results of LOCATE/FIND by setting this option to Y.
Replace existing members (COPY/MOVE)	As an IPT user, you are being provided an option while replacing existing members of PDS or PDSE. During COPY/MOVE, you can opt to proceed with replace, avoid replace, or replace if the version is old.
Member list line command pad character	You can choose the pad character to be used in member list line commands, such as Blank, Dot, Quote, or Underscore.
Main menu option 1 default process	You can choose the default process as Browse or View.
Main menu option 1, 2 @H display	Here, you can specify whether to view the result as an OLIST or not. Specify Y for OLIST.
Default cursor position	This option is the typical option where you can choose for the cursor to be positioned at the Main command or the Line command.
Include member names in dataset history	Specify this option to Y, if you want to view the member names while viewing the results of dataset history or @H.
Prompt with FIND command after a Global FIND	You can set this option to Y in order to view the FIND panel after viewing the results of Global FIND.
Double-byte-character-set (DBCS) support	This option has to be set as Y to support DBCS.
If DBCS is supported, use case-sensitive search strings	This option has to be set as Y to support case-sensitive DBCS search strings.
Commands executed by the TAILOR command	As an IPT user, you can specify the MSL commands that have to be executed when you use the TAILOR command on MSL. These commands will be the default commands that are executed when the TAILOR command is invoked.

## 12.4 Settings for Object List (OLIST)

You invoke the OLIST - Object List Options menu by typing 0 (for OLIST) in the IPT SET menu. Figure 12-5 on page 317 shows the various options for OLIST. Chapter 2, “Object Lists” on page 7 describes OLISTs in detail.

```

-IPT- -----OLIST - Object List Options-----
COMMAND ==>

Default command (when selecting an item) ==> B (B=Browse, E=Edit, V=View)
Show VOLSER of cataloged data-sets ==> Y (Y=Yes, N=No)
Check edit recovery when the list opens ==> N (Y=Yes, N=No)
Provide a field for TSO command parms ==> Y (Y=Yes, N=No)
Display mode (right column shows) ==> V (C=Class, V=Volume)
Default cursor position ==> M (M=Main command, L=Line cmd)
Include member names in dataset history ==> N (Y=Yes, N=No)
Double-Byte-Character-Set (DBCS) support ==> N (Y=Yes, N=No)
    If DBCS supported, use case-sensitive search strings ==> N

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-5 OLIST options

Table 12-2 describes the various options with their attributes that you can set for OLIST.

Table 12-2 OLIST settings and descriptions

OLIST setting	Description
Default command (when selecting an item)	This option provides the flexibility to open the dataset in one of three modes: Browse, Edit, and View.
Show the VOLSER of the cataloged datasets	This option provides the option to view the VOLSER of the dataset in the Object List view.
Check edit recovery when the list opens	This option allows you to include/exclude the edit recovery option when an object list is opened.
Provide a field for TSO command parameters	Setting this option to Y provides the line to issue TSO commands.
Display mode (the right column shows)	This option gives you the choice to view the CLASS or VOLUME of the dataset in the list.
Default cursor position	This option is the option to decide the default cursor position at the Main command and the Line command.
Include member names in the dataset history	Setting this option to Y allows you to view the most recently accessed member of the PDS or PDSE in the dataset history.
Double-byte-character-set (DBCS) support	This option must be set as Y to support DBCS.
DBCS case-sensitive search strings	This option must be set as Y to support case-sensitive DBCS search strings.

## 12.5 Settings for GLOBAL FINDTEXT

There are settings specific to the GLOBAL commands that are used for OLIST and MSL. You invoke the GLOBAL settings menu by typing G on the IPT SET menu. Figure 12-6 on page 318 shows the various options for the GLOBAL commands that are used with MSL and OLIST.

```

-IPT- -----GLOBAL/FINDTEXT commands options-----
COMMAND ==>

      MSL GLOBAL Control
STOP AFTER  ==> 9999 (Number of items to process successfully)
PROMPT AFTER ==> 50  (Number of items to process before prompt is issued)
START COLUMN ==> 1   (Quick FIND starting column in target data record)
END COLUMN  ==> 99999 (Quick FIND end column in target data record)
Specify Y (Yes) or N (No) for the following options:
AUTOMATIC   ==> Y (Process without editing successful items?)
LINK        ==> Y (Process each command only if previous command succeeds?)
PRINT       ==> N (Generate listing of each member changed and saved?)
EXCLUDE     ==> N (Exclude failing items from selection list?)

      OLIST FINDTEXT/MEMFIND Control
STOP AFTER  ==> 10   (Number of items to process successfully)
PROMPT AFTER ==> 10   (Number of items to process before prompt is issued)
START COLUMN ==> 1   (Starting column in target data record)
END COLUMN  ==> 99999 (End column in target data record)
Specify Y (Yes) or N (No) for the following options:
AUTOMATIC   ==> N (Search without stopping at successful items?)
EXCLUDE     ==> N (Exclude failing items from object list?)

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-6 Global options for MSL and OLIST

Table 12-3 describes the options for the MSL GLOBAL commands.

Table 12-3 MSL GLOBAL settings and descriptions

MSL GLOBAL command	Description
STOP AFTER	You can specify the limit or maximum number of items that must be processed successfully.
PROMPT AFTER	This number is the number of items that must be processed successfully before a prompt is issued.
START COLUMN	The column number specified will be used by QUICK FIND as the starting position in the data record.
END COLUMN	The column number specified will be used by QUICK FIND as the ending position in the data record.
AUTOMATIC	Set this option to Y for global processing to continue without editing for successful items.
LINK	Set this option to Y for global processing to continue provided the previous command is successful.
PRINT	Set this option to Y to generate the list of each member changed and saved.
EXCLUDE	Set this option to Y to exclude the failing items from the final Member Selection List.

Table 12-4 on page 319 describes the options for OLIST FINDTEXT/MEMFIND commands.

Table 12-4 OLIST GLOBAL settings and descriptions

OLIST GLOBAL setting	Description
STOP AFTER	You can specify the limit or maximum number of items that must be processed successfully.
PROMPT AFTER	This number is the number of items that must be processed successfully before a prompt is issued.
START COLUMN	The column number specified will be used for processing as the starting position in the data record.
END COLUMN	The column number specified will be used for processing as the ending position in the data record.
AUTOMATIC	Set this option to Y for global processing to continue without editing the successful items.
EXCLUDE	Set this option to Y to exclude the failing items from the final Member Selection List.

## 12.6 Settings for PRINT

IPT provides you with the flexibility to set certain options globally, thus, eliminating the repetition of selecting the options for each print action. The Print options menu is invoked by typing P on the IPT SET menu. Figure 12-7 shows the various settings for PRINT functions.

```

-IPT- -----Print options-----
COMMAND ==>

Suppress page formatting    ==> N (N=No, Y=Yes - file is already formatted)
Print changed lines in bold ==> N (N=No, Y=Yes)
Highlight program elements  ==> Y (N=No, Y=Yes - emphasize recognized items)
Process mode                ==> G (I=print immediately)
                             (G=Group requests for later printing)
                             (L=print direct to the ISPF LIST data set)

For process modes I and G:

DESTINATION ID             ==> (Node-id<.User-id>)
CLASS                      ==> A (or Sysout class)
WRITER name                ==> (Output WRITER)
Number of copies           ==> 1 (How many?)
Lines per page             ==> 60 (page size)
Keep in HOLD queue         ==> N (Y=Yes, N=No)
FORM number                ==>
FCB name                   ==>

NOTE: Under process modes I and G, your USERID will be on the separator page.
Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-7 PRINT options

Table 12-5 on page 320 shows the settings that are available for the Print options and their descriptions.

Table 12-5 PRINT settings and descriptions

Print setting	Description
Suppress page formatting	Specify Y or N depending on whether the file is formatted.
Print changed lines in bold	Specify Y to depict changed lines in bold.
Highlight program elements	Specify Y to highlight program elements (or reserved words).
Process mode	There are three processing modes available: I=Print immediately. G=Group requests for later printing. L=Print directly to the ISPF LIST dataset.

Table 12-6 describes the settings specific to process modes I and G.

Table 12-6 PRINT process mode setting descriptions

PRINT process mode setting	Description
DESTINATION ID	Specify the Node ID and user ID of the destination.
CLASS	Specify the SYSOUT class.
WRITER name	This name is an optional parameter.
Number of copies	Specify the number of required copies.
Lines per page	Specify the number of lines to be printed on a page.
Keep in HOLD queue	Specify if you want to place the print job in the HOLD queue.
FORM number	This number is an optional parameter.
FCB name	This name is an optional parameter.

## 12.7 Settings for DSLIST

You invoke the DSLIST options menu by typing D in the IPT SET menu. Figure 12-8 shows that various settings for the DSLIST functions.

```

-IPT- -----DSLIST options-----
COMMAND ==>

Specify the action to take when you leave the Command line blank and
press the Enter key:

  Default action ==> TP  DS=DSLIST
                        TP=Temporary Object List
                        PL=Permanent Object List

  Default LEVEL ==> IBMGRP.*
  VOLUME ==>
  DSLIST view ==> TOTAL (VOLUME,SPACE,ATTRIB,TOTAL)

  VOLUME list threshold ==> 100 To suppress summary data for speed

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-8 DSLIST options

DSLISIT is more commonly known as option 3.4 from the main IPT menu. As an IPT user, you can specify the default action to be taken when the command line is left blank.

Prior to describing the default action, we will explain the default values that are used in DSLISIT when these values are not specified. Table 12-7 shows the DSLISIT default settings and descriptions.

Table 12-7 DSLISIT default settings and descriptions

DLISIT default settings	Descriptions
LEVEL	The dataset specified in this entry will appear as the default dataset name in DSLISIT.
VOLUME	You can specify the VOLUME to appear as the default on DSLISIT. We suggest you leave this setting blank unless it is necessary to specify it.
VIEW	This setting is the option to specify the initial view of DSLISIT.
THRESHOLD	This option allows you to restrict the number of volumes to be searched and display the summary information per volume. Search will cease after the count of volumes reaches the limit specified. In other words, it controls the summary data display in the initial display of all selected volumes. You can optimize the number of volumes searched, and the results are available in less time. We suggest that you set this value depending on the count of volumes available on your system and the CPU speed of your system.

The entries on the DSLISIT menu will appear based on the options that you set for the DSLISIT settings. In the case of a scenario where the default level and the default action to be taken are left blank, IPT provides the choice of one of following actions as shown in Table 12-8.

Table 12-8 DSLISIT setting and description when the default level and default action are left blank

DSLISIT setting	Description
DS for DSLISIT	The command DS will appear as the default command.
TP for Temporary Object List	The menu to create the Temporary Object List will appear.
PL for Permanent Object List	The command PL will appear as the default command.

## 12.8 Setting for the Time Sharing Option Command Shell

There are certain options that you can set for the Time Sharing Option (TSO) Command Shell. Refer to Chapter 4, “TSO Command Shell” on page 135 for details. You invoke the TSO shell options menu by typing T in IPT SET menu. Figure 12-9 on page 322 shows the various settings that are available for TSO Shell functions.

```

-IPT- -----TSO shell options-----
COMMAND ==>

IBMIPT TSO command shell options:

  Use IBMIPT TSO shell ==> Y  (Y=Yes - Use the IBMIPT TSO shell)
                           (N=No  - Use the standard ISPF TSO shell)

  If IBMIPT shell active:

    Initial screen      ==> H  (H=History list, P=Permanent list)
    Automatic filling   ==> Y  (Y=Yes - Automatically fill permanent list, N=No)
    Output line number ==> 7  (Number of screen line where the output of TSO
                               commands is displayed)
    Command list limit ==> 999 (History and Permanent maximum number of entries)

  Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-9 TSO shell options

Use the IPT TSO shell options menu to choose whether to use the new IBMIPT TSO shell or to use the standard ISPF TSO shell. If you choose to use the IBMIPT TSO shell (type Y for “Use IBMIPT TSO shell”), you can use the additional settings that are shown in Table 12-9.

Table 12-9 TSO Command shell setting description

TSO command shell settings	Description
Initial panel	Depending on your choice, the history list or permanent list of TSO commands will be displayed. Type H to view the history list, or type P for the permanent list.
Automatic filling	If this option is set to Y, the TSO commands that you execute will be stored in the permanent list.
Output line number	The line number on the 3270 panel where the TSO command output will be displayed is specified in this option. Figure 12-9 shows the value is set to 7. Therefore, output will be displayed starting at line 7 onward.
Command list limit	This option can be used to cap the number of TSO commands that can be stored in the history list and in the permanent list. The maximum number of entries is 999. This option is extremely useful to optimize the space usage in your system. Setting this parameter to a lower value saves space that is allocated to store the history list and the permanent list.

## 12.9 Settings for EDIT/VIEW/BROWSE

EDIT/VIEW/BROWSE commands are widely used by ISPF or IPT users. You invoke the EDIT/VIEW/BROWSE options menu by typing E on the IPT SET menu.

Figure 12-10 on page 323 shows the various settings for the EDIT/VIEW/BROWSE functions. Table 12-10 on page 323 shows the descriptions of the available settings.

```

-IPT- -----EDIT/VIEW/BROWSE options-----
COMMAND ==>

Confirm CANCEL/MOVE/REPLACE commands      ==> N  (Y=Yes, N=No)
Enable edit/view highlights (coloring)     ==> Y  (Y=Yes, N=No)
Action bar (CUA pulldown menu) active      ==> Y  (Y=Yes, N=No)
Display OLIST of History-List (@H)         ==> Y  (Y=Yes, N=No)
Prompt with FIND command after a Global FIND ==> Y  (Y=Yes, N=No)

VIEW requires exclusive use of file        ==> Y  (Y=Yes, N=No)
(namely only one user can view/edit the same file)

      Cut and Paste Options                ==> 1  (1,2)

      Explanation of Cut and Paste Options
(1) IPT CUT/PASTE                          CUT/PASTE commands are IPT's for all
                                           applications (ISPF, SDSF, OMVS, etc.)
(2) ISPF CUT/PASTE                        CUT/PASTE commands are ISPF's for all
                                           applications
Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-10 EDIT/VIEW/BROWSE options

Table 12-10 EDIT/VIEW/BROWSE settings and descriptions

EDIT/VIEW/BROWSE settings	Description
Confirm CANCEL/MOVE/REPLACE commands	Setting this option to Y enables you to view a confirmation panel while performing CANCEL/MOVE/REPLACE.
Enable edit/view highlights (coloring)	This option enable you to use the HILITE command on the EDIT/VIEW panels.
Action bar (Common User Access (CUA) drop-down menu) active	You can activate the Common User Access menu to add or change attributes associated with color, highlighting, and the intensity of the elements on the ISPF panels.
Display OLIST of History-List (@H)	This option displays the OLIST when you opt for the History List.
Prompt with FIND command after a Global FIND	Type Y to set this option to Yes in order to view the FIND panel after viewing the results of Global FIND.
VIEW requires exclusive use of file	Unlike ISPF, IPT provides you an additional facility to view files in exclusive mode.
Cut and Paste options	Type 1 or 2 to choose between the powerful IPT Cut and Paste and the traditional ISPF Cut and Paste.

## 12.10 Settings for the User Interface

The User Interface is associated with action bars and HOTBARS that are available on specific ISPF panels. You can choose the availability of action bars and HOTBARS on certain panels by setting the appropriate option. You invoke the User Interface Options menu by typing I on the IPT SET menu.

Figure 12-11 on page 324 shows the various settings for the User Interface functions.

```

-IPT- -----User Interface Options-----
COMMAND ==>

+-----+
| Note: Changes specified on this screen may not affect all of the |
| panels that are currently displayed in nested applications. |
+-----+

Verify or specify the following options: (Enter Y for Yes, N for No):

Activate HOTBARS                      ==> Y
Activate Action Bars                  ==> Y
  If Action Bars are active:
    Display Action Bars in Browse, Edit, View  ==> Y
    Display Action Bars in Member Selection List ==> Y
    Display Action Bars in the object list      ==> Y
    Display Action Bars in DSLIST              ==> Y

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-11 User Interface options

Table 12-11 describes the various options for the User Interface.

Table 12-11 User Interface settings and descriptions

User Interface setting	Description
Activate HOTBARS	This option must be set to Y to activate HOTBARS and make them available on ISPF panels.
Activate Action bars	This option must be set to Y to activate Action bars and make them available on ISPF panels.

There are four sub-options within the Action bars that provide you with more flexibility by having the Action bars display on the BROWSE/EDIT/VIEW, MSL, Object List, and DSLIST panels.

## 12.11 Settings for diagnostics

As an IPT user, you can set the options to diagnose any errors that are encountered during the use of IPT. This option will provide assistance only when errors arise due to issues that are related to ISPF and IPT panels. Figure 12-12 on page 325 shows the various settings for diagnostic functions. You invoke the Diagnostics Options panel by typing N on the IPT SET menu.

```
-IPT- -----Diagnostics Options-----  
COMMAND ==>  
  
The following options provide error diagnostic information. Verify  
or change these options. To restore the installation default  
settings enter CANCEL on the main command line.  
  
Diagnose panel processing errors                ==> N (Y=Yes, N=No)  
Diagnose ISPF program invocation errors and ABENDs ==> N (Y=Yes, N=No)  
Display panel identifier (name) on each panel    ==> N (Y=Yes, N=No)  
Note: Setting this option to Y overrides the effects of PANELID OFF.  
  
Press ENTER for options menu, END to exit, CANCEL for installation defaults.
```

Figure 12-12 Diagnostics Options

The options on Figure 12-12 determine these functions:

- ▶ Diagnose panel processing errors: Setting this option to Y allows you to view and use the diagnostic help that is provided by IPT to analyze ISPF panel processing errors.
- ▶ Diagnose ISPF program invocation errors and ABENDs: Setting this option to Y allows you to view and use the diagnostic help that is provided by IPT to analyze ISPF program invocation errors and ABENDs that are associated with ISPF during the processing.
- ▶ Display panel identifier (name) on each panel: Setting this option to Y displays the ISPF panel identifier (name) on the top of the panel. The command PANELID (OFF/ON) is usually used to display the panel identifier for each ISPF panel. However, setting this IPT option to Y overrides the function set by PANELID OFF.

## 12.12 Settings for the persistent table library

Persistent tables are significant for an IPT user, because a persistent table stores the OLIST, MSL, and IPT settings after you log off from IPT. You invoke the Persistent Table Library Options panel by typing L on the IPT SET menu. Here, we describe the various choices that you can make while allocating persistent tables.

Figure 12-13 on page 326 shows the various settings for persistent table library functions.

```

-IPT- -----Persistent Table Library Options-----
COMMAND ==>

      IBMIPT uses DD(IPITBLIB) for specifying a personal library as a
      repository of persistent tables, such as CUT/PASTE clipboards and
      the TSO-SHELL command lists. This library may be dynamically allocated
      or disabled by electing one of the following actions:

      A Allocate an existing or a new library for this purpose.

      B Backup the current table library and allocate space for a new one.

      T Temporarily disable its use for this session. At the next IBMIPT startup
        you will be prompted again to elect how to use this facility.

      P Permanently disable its use. This facility will be disabled until you
        explicitly use the SET command to change this status.

      A <== Elect persistent table library action.

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-13 Persistent Table Library Options

IPT provides you with four choices to use persistent tables, as shown in Table 12-12.

Table 12-12 Persistent tables setting description

Option	Action taken by IPT
A	IPT allocates an existing or new library to store persistent tables. A panel will prompt you to specify the name of an existing or new library.
B	IPT backs up the current table library and allocates space for a new library.
T	The use of persistent tables is temporarily disabled only for the current session.
P	The use of persistent tables is disabled permanently. You have to explicitly use the ISET command to enable it for future sessions.

## 12.13 Setting for the BookManager interface

BookManager is an IBM product that is widely used by System z users. You invoke the BookManager Interface Options panel by typing B on the IPT SET menu. Figure 12-14 on page 327 shows the various settings for BookManager Interface functions. IPT can identify the BookManager objects by the dataset name and other attributes. You can use the BookManager Interface options within IPT to set basic options.

```

-IPT- -----BookManager Interface Options-----
COMMAND ==>

      IBMIPT recognizes IBM BookManager objects by examining their dataset
      names and optionally verifying some pertinent attributes.

BookManager interface status ==> D  ( A ctivate  D eactivate)

Set BOOKSHELF defaults:
  Data set name suffix ==> BKSHELF (blank to ignore)
  Data set record format ==> VB    (blank to ignore)
  Data set record length ==> 0      (zero to ignore)

Set BOOK defaults:
  Data set name suffix ==> BOOK     (blank to ignore)
  Data set record format ==> FB     (blank to ignore)
  Data set record length ==> 0      (zero to ignore)

Press ENTER for options menu, END to exit, CANCEL for installation defaults.

```

Figure 12-14 BookManager Interface Options

On Figure 12-14, the BookManager interface status prompt is the most important option. It either activates (using A) or deactivates (using D) the BookManager options. IPT has specific options for Bookshelves and Books within these options. You can set the suffix for the dataset name, its record format, and its record length for Bookshelves and Books. It is not mandatory to provide values for these fields. You can ignore a field by providing blanks or zeroes as appropriate.

Archived

## SCLM integration with IPT

The Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS interfaces with the IBM Software Configuration and Library Manager (SCLM) to provide you with all of the functionality of IPT with frequently used SCLM functions.

## 13.1 Customization to support SCLM

SCLM requires more information when creating members, such as lock information, change codes, and alternate project libraries. To minimize the collection of SCLM information for non-SCLM users, the IPT customization wizard provides the following SCLM customization options:

- ▶ All users are SCLM users.
- ▶ There are no SCLM users.
- ▶ Users are identified by an IQISCLM DD DUMMY statement in their LOGON procedure.

Figure 13-1 is the beginning of the IPT customization wizard SCLM panels.

```
----- IBMIPT - Customization Wizard -----
COMMAND ==>

Select the optional object classes to be supported.  Internal
object classes are already preselected.  If you are unsure, select
all options to get more information about each one.  You will be
able to de-select undesired option later.

Select  Object Class                      Notes
-----
S       Sequential data sets              Built-in IBMIPT support
S       PDS and PDSE libraries            Built-in IBMIPT support
S       Open Edition files                Requires OpenEdition MVS
S       PC files                          Requires ISPF workstation
=       Panvalet libraries                Interfaces to third party product
-       Librarian files                   Interfaces to third party product
-       PDSMAN libraries                  Activates built-in support
S       VSAM data sets                    Interfaces to third party product
S       DB2 tables                        Interfaces to third party product
S       User defined objects              Define your own interface
S       SCLM support                      Activates built-in support

Press ENTER to proceed or the END key to return to the initial screen.
```

Figure 13-1 IPT customization wizard: SCLM support

Enter S, and Figure 13-2 is displayed to provide SCLM support through IPT.

```
----- IBMIPT - Customization Wizard -----
COMMAND ==>

SCLM is ISPF's Software Configuration and Library Manager.  SCLM provides
controlled edit capabilities within standard PDS libraries (with member locking,
check-in/check-out), full development life cycle of applications (including
a "MAKE"), and extensive reporting.  SCLM is an integrated part of ISPF.

IBMIPT can provide significant benefits to SCLM users by integrating SCLM
support into the standard member list, DSLIST and OLIST.  If your installation
uses SCLM, it is recommended that you activate the SCLM support on this screen.

Activate SCLM support ==> D Y =Yes - Support SCLM for all users
                        N =No  - Do not provide SCLM support
                        D =Conditional support.  SCLM will only be
                          supported for users who at the time IBMIPT is
                          started, have a preallocated DD "IQISCLM".
                          This DD can be allocated in the LOGON PROC/CLIST.
                          Example: ALLOC DD(IQISCLM) DUMMY
                                   or  //IQISCLM DD DUMMY

Press ENTER to proceed or the END key to return to the initial screen.
```

Figure 13-2 IPT customization wizard: Activate SCLM support

The installation provides conditional SCLM support. Your IPT session supports the SCLM commands, provided that you have the DD name, IQISCLM, allocated to your LOGON procedure.

**Hint:** If your installation provided conditional SCLM support and your LOGON procedure does not have the //IQISCLM DD DUMMY statement, or CLIST does not have ALLOC DD(IQISCLM) DUMMY, you can dynamically add it. Exit from ISPF, and enter the command ALLOC DD(IQISCLM) DUMMY. Invoke ISPF, and your session will be SCLM-enabled.

The SCLM parameter prompt in Figure 13-3 refers to the SCLMPARM panel in Figure 13-4.

```

----- IBMIPT - Customization Wizard -----
COMMAND ==>
Verify SCLM options:
SCLM parameter prompt ==> F Y =Yes - Whenever an SCLM library is accessed.
                               N =No - Users must preset the parameters with
                               the SCLMPARM command (in the Member List).
                               F =A prompt screen is displays only on first time
                               access to a specific library. Thereafter the
                               previous parameters for that library are used.

Note:the above option can be changed by individual users via the SET command.

The folowing option applies to ISPF Version 4.1 or above:
Override SCLMCHK value ==> * (W=WARN, E=ERROR, N=NONE, *=no override)
This setting allows you to override the value of the "SCLMCHK" field in
ISRCNFG (ISPF's configuration table). This field defines how edit should
react when attempting to edit an SCLM-saved file without SCLM locking.

SCLMCHK values (See ISPF Customization for more details):
WARN  -Display a warning message if edited project/member is SCLM controlled.
NONE  -No checking is done. No warning messages issued.
ERROR -Reject editing of SCLM-saved members without SCLM or IBMIPT locking.

Press ENTER to proceed or the END key to return to the initial screen.

```

Figure 13-3 IPT customization wizard: SCLM parameter prompt and override SCLMCHK value

For the SCLM parameter prompt in Figure 13-3, the recommended setting is F, which will display the SCLMPARM panel that is shown in Figure 13-4 when an SCLM library is first accessed.

The Override SCLMCHK option provides a way to override the SCLM locking. We recommend that you set this value to an asterisk (\*), provided that there are no SCLM lock overrides.

```

                                          -IPT-
Command      ==>
GROUPS: 1=DEVI025  2=INT420  3=TEST420  4=RLSE420  5=
Project: SOFPAUD  Group: DEVI025  Type: ASM
Specify/verify SCLM parameter for this library:
Lock          ==> YES          (Yes, No)
Alternate      ==>            (Alternate project name)
Change code    ==>
Language       ==>            (Default language)
Auth. code     ==>
F1=HELP      F2=SPLIT  F3=END    F4=VIEW  F5=RFIND  F6=RCHANGE
F7=UP        F8=DOWN   F9=SWAP   F10=LEFT F11=RIGHT

```

Figure 13-4 Initial SCLMPARM panel

On Figure 13-4 on page 331, you can set the following values:

- ▶ Lock: Yes will lock members from other SCLM users.
- ▶ Alternate: SCLM macros define the characteristics of the SCLM hierarchy. The library hlq.PROJDEFS.LOAD contains the assembled and linked SCLM macro definitions. If you want to override the default member name of the SCLM definition, you can use a different (alternate) SCLM member, which is specified here.
- ▶ Change code: You can specify the default change code.
- ▶ Language: You can specify the default language.
- ▶ Authorization (Auth.) code: You can specify the default authorization code.

The fields that are defined by the SCLMPARM command apply only to the SCLM library that is currently edited by IPT. For example, you can set SCLMPARM values for the library SOFTAUD.DEVI205.ASM to the language HLASM, and the SOFTAUD.DEVI205.JCL library can have the language TEXT.

**Hint:** The SCLMPARM provides the *default* values when you add new members to an SCLM library. You can override these parameters using the SPROF command.

You can override the default installation values of Lock and Display SCLM parameters for your ISPF sessions by using the ISET parameter. Select SCLM options by typing S next to SCLM as shown in Figure 13-5.

```
-IPT- -----Setting IBMIPT Defaults-----
COMMAND ==>
Select options by number, name, with cursor selection, or with line commands:
  IBMIPT is running under ISPF version 5.7

- A - ALL          - Select all the below displayed options
- M - MSL          - Member Selection List options
- P - OLIST        - Object list options
- G - GLOBAL       - Global edit and Findtext options
- R - PRINT        - Print options
- D - DSLIST       - DSLIST options
- T - TSO          - TSO shell options
- E - EDIT         - Edit, Browse and View options
- I - INTERFACE    - Specify user interface options
- S - SCLM         - SCLM options
- N - DIAGNOSE     - Diagnose ISPF errors
- L - LIBRARY      - Persistent table library options

Make your selection and press the ENTER key or press the END key to exit
```

Figure 13-5 User SCLM options

You can override the LOCK default for all SCLM libraries for your ID, as shown in Figure 13-6.

```
-IPT- -----SCLM Options-----
COMMAND ==>

Verify or specify the following options:

Edit locks members in SCLM controlled libraries ==> Y (Y=Yes, N=No)
Display SCLM parameters before accessing library ==> F (Y=Yes, N=No,
F=First time only)

Note: When the F option (first time) is active, IBMIPT will try to find the
previously specified parameters for the current combination of PROJECT
and TYPE. If none are found, a prompt window is displayed. As IBMIPT
"learns" about these parameters, the prompt window will be displayed
less frequently.

Press ENTER for options menu, END to exit, CANCEL for installation defaults.
```

Figure 13-6 SCLM Options panel

## 13.2 SCLM IPT interface

Figure 13-7 defines the SCLM hierarchy that we used in the examples in this section.

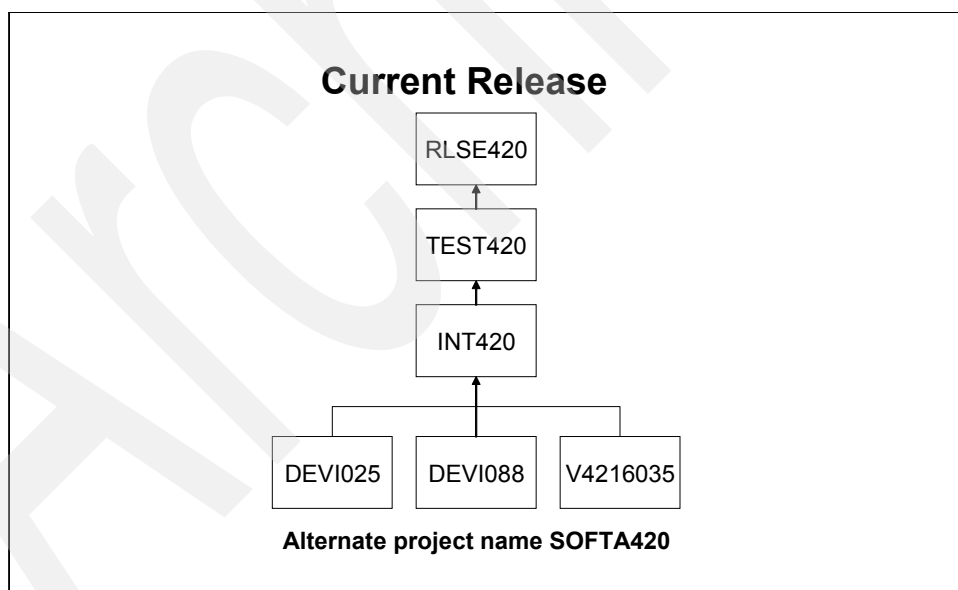

Figure 13-7 SCLM hierarchy

The Alternate project name SOFTA420 defines the SCLM hierarchy that is shown in Figure 13-7. Each level contains a number of datasets, such as SOFTAUD.DEV1025.ASM, LOAD, ARCHDEF, and so on.

The Object List '<' character, shown on line 6 of Figure 13-8, denotes an SCLM library. Enter the lowest level library in the SCLM hierarchy.

```

Figure 13-10 SCLMPARM panel populated with data

The SCLMPARM panel provides the default values that SCLM uses for new members. You might need to update the alternate project name to direct SCLM to the correct libraries. The examples in this chapter use the data that is shown in Figure 13-10.

In Figure 13-11, the DEF E action sets the default action to EDIT. The 7 initiates an edit session with concatenated libraries. IPT classified the datasets on line 7 as ISPF concatenated libraries.

## 13.3 IPT SCLM walk-through

In this section, which includes Figure 13-15 on page 338 through Figure 13-51 on page 355, we use IPT and SCLM to show you how to perform these tasks:

- ▶ Create a new assembler program.
- ▶ Migrate members to SCLM.
- ▶ Update the project SCLM ARCHDEF members.
- ▶ Build and promote the SCLM ARCHDEF members.
- ▶ Remove an obsolete program.

### 13.3.1 Creating a new assembler program

In this section, we show you how to create a new assembler program and how to assemble it:

1. Edit the SCLM hierarchy that is shown Figure 13-15 on page 338.

```

Figure 13-43 Entering the k command

The parameter PROMOTE invokes the SCLM Promote - Entry Panel that is depicted in Figure 13-44 on page 352. Using the EX primary command, the project \$TSTASM is promoted successfully to the INT420 library.

### 13.3.5 Removing the obsolete program

In this section, we show you how to remove the obsolete program.

We completed the Migrate, Build, and Promotion changes for our project. Figure 13-48 on page 354 depicts an easy way to switch to the ASM hierarchy and view a subset of members using the TAILOR command. The TAILOR command will display only members that were changed in the last 60 days.

```

## **IPT double-byte character set support**

The double-byte character set (DBCS) is a set of characters in which each character is represented by 2 bytes. Several languages, such as Chinese, Japanese, and Korean, contain more characters than can be represented by 1 byte or 256 code points, thus requiring two bytes to uniquely represent each character.

Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS includes the following enhancements for DBCS support:

- ▶ OLIST FINDTEXT command now supports DBCS search strings.
- ▶ OLIST titles and comment lines can include DBCS character strings.
- ▶ MSL FINDTEXT and GLOBAL FIND commands now support DBCS search strings.
- ▶ IPT SET options can disable or enable double-byte-character-set (DBCS) support and DBCS case-sensitive search strings.

This chapter provides information about how you can use IPT with double-byte character strings in the Object List (OLIST) and Member Selection List (MSL).

## 14.1 Using DBCS with the Object List

We discuss the OLIST-related DBCS support topics first, and then, we discuss the MSL-related DBCS support topics. To display or edit DBCS characters, first of all, we must have a DBCS-capable terminal, or a PC running a DBCS-capable OS and terminal emulation software. And then, we need perform configuration changes.

### 14.1.1 Configuration for DBCS support

Here, we use IBM Personal Communication as our terminal emulation software. To support DBCS characters, we must select the correct host codepage first in the PCOMM communication configuration. To do that, in the PCOMM window, select **Communication**, and then, **Configuration**, as shown in Figure 14-1.

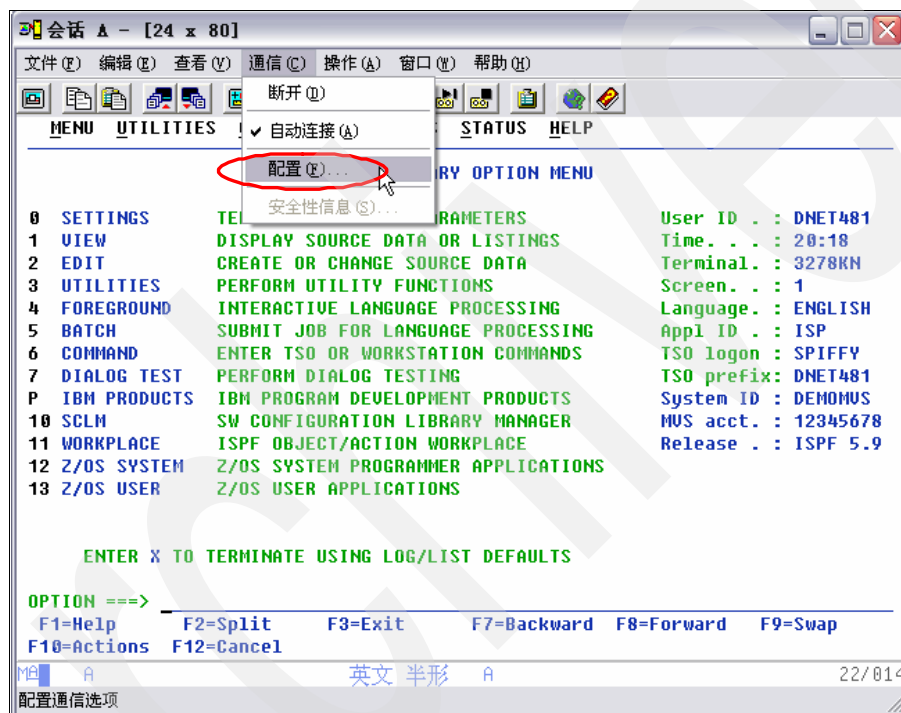

Figure 14-1 Configuring DBCS support in PCOMM, part 1

On the pop-up panel, click **Session Parameters**, which is shown in Figure 14-2 on page 359.

Figure 14-2 Configuring DBCS support in PCOMM, part 2

Then, on the pop-up panel, for the host codepage pull-down list box, select **1388 Chinese**, as shown in Figure 14-3.

Figure 14-3 Configuring DBCS support in PCOMM, part 3

After that, we must ensure that the HOST ISPF settings specify a terminal type that supports DBCS characters. To specify the Terminal Type in ISPF, in the ISPF Primary Option Menu

panel, select option 0 Settings by typing 0 on the option line, as shown in Figure 14-4 on page 360.

```

Figure 14-10 Setting OLIST DBCS support options, part 3

Now, we have finished all of the configurations for OLIST DBCS support.

### 14.1.2 Using DBCS with the Object List description

The dataset in Figure 14-11 on page 364 contains records with single and multiple DBCS characters, pure and mixed DBCS strings, and proper and improper DBCS strings. This dataset is comprehensive so that we can demonstrate the usage of DBCS.

```

Figure 14-14 Creating permanent OLIST, part 3

In IPT Version 6.1, OLIST titles and comment lines can include DBCS character strings. This capability gives the OLIST and its objects a more meaningful description. Next, we add DBCS titles and comment lines in OLIST DBCS.

Place the cursor in the description area, and press Enter. Currently, the description is LEVEL DNET481.IPTTEST.\*, as shown in Figure 14-15.

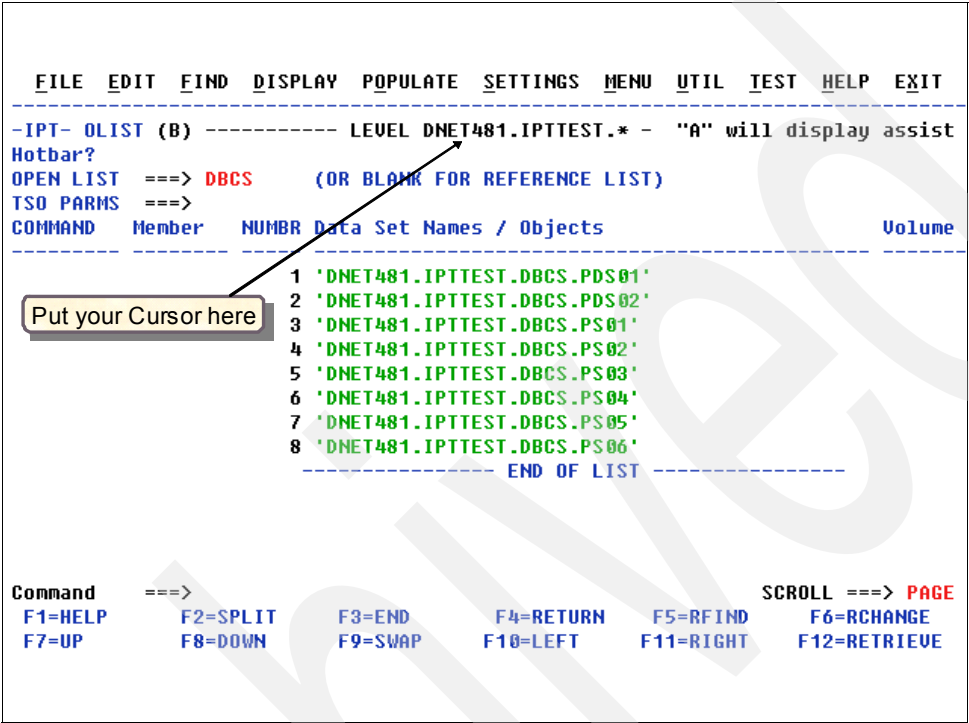

Figure 14-15 DBCS titles, part 1

A pop-up panel is displayed. Type the description that you want, and press Enter, as shown in Figure 14-16 on page 367.

Figure 14-25 Find a DBCS only string, part 3

We tried many scenarios against the permanent OLIST DBCS. Table 14-1 shows the results.

Table 14-1 Other test scenarios

Scenario	Result	Comment
FT	Success	Find 1-character only DBCS string.
FT	Success	Find DBCS only substring in DBCS only string.
FT	Success	Find DBCS only substring in mixed DBCS string.
FT	Success	
FT	Success	
FT [improper string]	Success or failure, it depends	Find improper substring in improper DBCS string. Improper DBCS is treated as SBCS.
FT 7	Success	Find mixed DBCS substring in mixed DBCS string, case insensitive.
FT x	Success	
FT XYZ	Success	
FT 567 xYZ	Success	
FT XYZ	Failure	Find that mixed DBCS substring does not exist in mixed DBCS string.
FT 567 xyz	Failure	

## 14.2 Using DBCS with the Member Selection List

As we discussed in the beginning of this chapter, the MSL FINDTEXT and GLOBAL FIND commands support DBCS search strings.

### 14.2.1 Enable MSL DBCS support

To enable MSL DBCS support, we must set the DBCS support option in IPT first. We can use the command shortcut ISET in any panel, as shown in Figure 14-26.

```

Figure 14-33 Global Find command for DBCS, part 2

We tried many situations, single character and multi-characters, pure DBCS and mixed DBCS, full string and substring, proper and improper string, and get the following conclusion.

The MSL commands Find Text and Global Find fully support DBCS, and improper DBCS is treated as SBCS.

# Customizing IBM Personal Communications

Most 3270 emulators allow you to customize the keyboard or the mouse. In this chapter, we show you how to customize the IBM Personal Communications (PCOM) product to use the mouse to navigate using the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS. If you use another 3270 emulator, consult the appropriate documentation to change your mouse settings. Using the PCOM emulator, we redefine our mouse left-click key to open files, and the mouse right-click to close files. Using this method, you can quickly navigate Object Lists and Member Selection Lists with a click of the mouse.

With PCOM, the default mouse settings are set this way:

- ▶ A left click marks the box around the text for cut and paste activities.
- ▶ A right click displays keys.

Defining the mouse for Point-and-Click for IPT disables the current mouse functions. In the following sections, we describe how to perform these two functions without a mouse.

## Marking the box for cut and paste activities without the mouse

Figure A-1 shows the basic keyboard arrows.

Figure A-1 Keyboard arrows

To mark a box around text for cut and paste activities without the mouse:

1. Use the keyboard arrows shown in Figure A-1 to move the cursor to a corner of the area that you want to mark.
2. While holding down the Shift key, use the cursor-movement keys to mark the area.
3. Release the Shift key.
4. You can use the mouse to click **Edit** → **Copy** to continue with the copy operation.

## Displaying the pop-up keypad panel without a mouse

Figure A-2 shows the basic pop-up keypad panel.

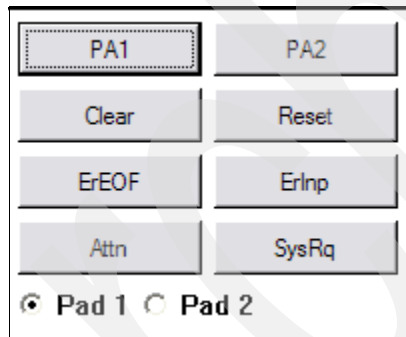

Figure A-2 Pop-up keypad panel

To display the pop-up keypad without using the mouse:

- ▶ Left-click the **Action** menu bar command.
- ▶ Left-click the display pop-up keypad.

Because you now have an alternate method to mark text and to display the pop-up keypad, you are ready to program your mouse to open and close files.

## Changing PCOM to use the mouse to open and close files

Use the following steps to customize PCOM to use the mouse to open and close files:

1. Open a PCOM session.
2. Left-click **Edit** → **Preferences** → **Macro/Script**.

3. Click **Customize**.
4. Click the pull-down list. Scroll down until you find the mouse position. Click the mouse position to highlight it, and then click **Add**.
5. Scroll up until you find Enter. Click **Enter** to highlight it, and click **Add**. You will now see both commands [mouse position] and [enter] in the Macro Statements box.
6. Click **File** → **Save**. Enter a name for the Macro, such as mouse.mac., as shown in Figure A-3.

Figure A-3 Macro/Script File → Save

7. Close the Macro/Script window by clicking the **X** in the upper-right corner of the box. The previous steps defined the macro file mouse.mac and positioned the cursor and invoked Enter.

The next series of steps defines the mouse actions:

1. Left-click **Edit** → **Preferences** → **Mouse**.
2. Left-click **User-Defined**, and then left-click **Customize**.
3. When you see the completed Customization panel, follow these steps:
  - a. Left-click in the Macro/Script box, and locate the Macro/Script file name that you saved earlier.
  - b. When you find the correct file name, click the **Left** box of the Current Action of Mouse Button, which enables the Macro/Script that you created earlier by using the left-mouse click.
  - c. Left-click the **Function Pull Down**, and locate Program Function Key 3. Your PF3 key is set to END, which saves and closes files. Select **Program Function Key 3**.
  - d. Left-click the **Right** box of the Current Action of Mouse Button.
  - e. Click the red **X** to close the Customize Mouse panel, and the Figure A-4 on page 382 is displayed, as shown in Figure A-4 on page 382.

Figure A-4 Emulator (keyboard) confirmation panel

- f. Click **Yes**.
- g. Enter a valid file name. Save the MMP file.

## Touring IPT using the mouse-enabled point-and-click function

Now, our mainframe session is starting to behave like our workstation. We can open and close files with a click of our mouse, as shown in Figure A-5 and Figure A-6 on page 383. To tour IPT:

# Improving Productivity with ISPF Productivity Tool V6.1

**Redbooks®**

**Access the ISPF environment easily**

**Enhance your system navigation**

**Learn how to point and shoot objects**

This IBM Redbooks publication introduces the Interactive System Productivity Facility (ISPF) Productivity Tool (IPT) Version 6, Release 1 for z/OS. IPT operates as a seamlessly integrated front end to ISPF:

- ▶ IPT functionality is available from any panel without a need to modify any ISPF Primary Options Menu. All IPT functions are totally integrated. IPT can perform almost any activity within ISPF, or internally invoke the function that can perform the task.
- ▶ IPT combines separately provided ISPF utility functions and new ISPF Productivity Tool features into the Object List (OLIST) and Member Selection List (MSL). The resulting member, dataset, and object lists become powerful platforms where you can perform many tasks without navigating to other utilities.
- ▶ IPT relates objects to applications in a similar manner to the way that a PC performs Object Linking and Embedding (OLE). By extending the dataset objects that are used by ISPF to other object classes, IPT lets you specify the object to be processed and the action that is performed (such as EDIT or BROWSE). The facility that is appropriate to the object class for the action that you have requested is invoked automatically.
- ▶ IPT provides extensive search capabilities that are both rapid and intuitive. You can easily search for volumes, datasets, members, and text within members. ISPF Productivity Tool also furnishes automatic drill-down system navigation to examine volumes, datasets, and members.
- ▶ IPT provides a menu-driven facility to display and recover all of the deleted members of a partitioned dataset (PDS) library.
- ▶ IPT extends the ISPF Action Bar with options that provide access to new functionality so that you do not have to learn new commands or syntax. In addition to the ISPF point-and-shoot capabilities, IPT provides new concepts, such as hotbars (user-defined fields that execute commands), field-sensitive areas in MSLs and OLISTs, automatic recognition of a dataset name on any ISPF panel as a parameter to BROWSE, EDIT, or VIEW, or parameters within any Time Sharing Option (TSO) command.

Practical scenarios, accompanied by detailed screen captures and coding examples, demonstrate how to take advantage of the IPT enhanced functionality in every case. This book is intended for anyone who wants to learn more about IPT.

## INTERNATIONAL TECHNICAL SUPPORT ORGANIZATION

### BUILDING TECHNICAL INFORMATION BASED ON PRACTICAL EXPERIENCE

IBM Redbooks are developed by the IBM International Technical Support Organization. Experts from IBM, Customers and Partners from around the world create timely technical information based on realistic scenarios. Specific recommendations are provided to help you implement IT solutions more effectively in your environment.
