**Chapter 1. IBM Spectrum Archive Enterprise Edition** ....... 1
  1.1 Introduction ........................................................... 2
    1.1.1 Operational storage ........................................... 4
    1.1.2 Active archive ................................................ 5
  1.2 IBM Spectrum Archive EE functions ............................ 6
    1.2.1 User Task Reporting ....................................... 7
  1.3 IBM Spectrum Archive EE components .......................... 9
    1.3.1 IBM Spectrum Archive EE terms ......................... 9
    1.3.2 Hierarchical Storage Manager .......................... 12
    1.3.3 Multi-Tape Management Module ....................... 13
    1.3.4 IBM Spectrum Archive Library Edition component .... 14
  1.4 IBM Spectrum Archive EE cluster configuration introduction .. 14

**Chapter 2. IBM Spectrum Archive overview** ....................... 17
  2.1 Introduction to IBM Spectrum Archive and LTFS ............. 18
    2.1.1 Tape media capacity with IBM Spectrum Archive .... 20
    2.1.2 Comparison of the IBM Spectrum Archive products .... 22
    2.1.3 IBM Spectrum Archive Single Drive Edition .......... 22
    2.1.4 IBM Spectrum Archive Library Edition ................ 24
    2.1.5 IBM Spectrum Archive Enterprise Edition ............. 25
  2.2 IBM Spectrum Scale ............................................... 28
    2.2.1 Overview ................................................... 29
    2.2.2 Storage pools .............................................. 29
    2.2.3 Policies and policy rules ................................ 30
    2.2.4 Migration or premigration ............................... 31
    2.2.5 Active File Management .................................. 32
  2.3 OpenStack SwiftHLM ............................................. 33
Chapter 3. Planning ................................................................. 39
  3.1 System requirements .................................................. 40
    3.1.1 Limitations ..................................................... 41
  3.2 Required software .................................................... 42
  3.3 Hardware and software setup ....................................... 44
  3.4 Sizing and settings .................................................. 46
    3.4.1 IBM Spectrum Archive EE metadata file system .......... 46
    3.4.2 Redundant copies ........................................... 47
    3.4.3 Performance ................................................ 47
    3.4.4 Ports that are used by IBM Spectrum Archive EE ....... 51

Chapter 4. Installation ........................................................ 53
  4.1 Installing IBM Spectrum Archive EE on a Linux system ....... 54
  4.2 Installation prerequisites for IBM Spectrum Archive EE ....... 54
    4.2.1 Installing the host bus adapter and device driver .... 55
  4.3 Installing IBM Spectrum Archive EE ................................ 55
    4.3.1 Installing, upgrading, or uninstalling IBM Spectrum Archive EE 58
  4.4 Installing a RESTful server ........................................ 64
  4.5 Quick installation guide for IBM Spectrum Archive EE ....... 69
  4.6 Library replacement ................................................. 69
    4.6.1 Library replacement procedure ................................ 70
    4.6.2 Pool relocation procedure .................................. 72

Chapter 5. Configuration ....................................................... 77
  5.1 Configuration prerequisites ........................................ 78
    5.1.1 Configuration worksheet tables ............................ 78
    5.1.2 Obtaining configuration information ....................... 81
    5.1.3 Configuring key-based login with OpenSSH ............... 83
    5.1.4 Preparing the IBM Spectrum Scale file system for IBM Spectrum Archive EE 84
  5.2 Configuring IBM Spectrum Archive EE ............................. 85
    5.2.1 The ltfssee_config utility .................................. 85
    5.2.2 Configuring a single node cluster ......................... 88
    5.2.3 Configuring a multiple-node cluster ....................... 92
    5.2.4 Configuring a multiple-node cluster with two tape libraries 95
    5.2.5 Modifying a multiple-node configuration for control node redundancy 96
  5.3 First-time start of IBM Spectrum Archive EE .................... 98
    5.3.1 Configuring a Centralized Archive Repository solution 99
    5.3.2 Configuring an Asynchronous Archive Replication solution 103

Chapter 6. Operations .......................................................... 109
  6.1 Overview ............................................................... 111
    6.1.1 IBM Spectrum Archive EE command summaries .......... 111
    6.1.2 Using the command-line interface .......................... 115
  6.2 Status information ................................................... 116
    6.2.1 IBM Spectrum Scale .......................................... 116
    6.2.2 IBM Spectrum Archive Library Edition component ...... 117
    6.2.3 Hierarchical Space Management ............................. 118
    6.2.4 IBM Spectrum Archive EE .................................. 120
  6.3 Upgrading components ............................................... 121
### 7. Hints, tips, and preferred practices

Preface

This IBM® Redbooks® publication helps you with the planning, installation, and configuration of the new IBM Spectrum® Archive v1.3.0.6 for the IBM TS4500, IBM TS3500, IBM TS4300, and IBM TS3310 tape libraries. IBM Spectrum Archive EE enables the use of the LTFS for the policy management of tape as a storage tier in an IBM Spectrum Scale based environment. It helps encourage the use of tape as a critical tier in the storage environment. This is the eighth edition of IBM Spectrum Archive Installation and Configuration Guide.

IBM Spectrum Archive EE can run any application that is designed for disk files on a physical tape media. IBM Spectrum Archive EE supports the IBM Linear Tape-Open (LTO) Ultrium 8, 7, 6, and 5 tape drives in IBM TS3310, TS3500, TS4300, and TS4500 tape libraries. In addition, IBM TS1160, TS1155, TS1150, and TS1140 tape drives are supported in TS3500 and TS4500 tape library configurations.

IBM Spectrum Archive EE can play a major role in reducing the cost of storage for data that does not need the access performance of primary disk. The use of IBM Spectrum Archive EE to replace disks with physical tape in tier 2 and tier 3 storage can improve data access over other storage solutions because it improves efficiency and streamlines management for files on tape. IBM Spectrum Archive EE simplifies the use of tape by making it transparent to the user and manageable by the administrator under a single infrastructure.

This publication is intended for anyone who wants to understand more about IBM Spectrum Archive EE planning and implementation. This book is suitable for IBM clients, IBM Business Partners, IBM specialist sales representatives, and technical specialists.

Authors

This book was produced by a team working at the IBM Tokyo and IBM Tucson development labs.

Hiroyuki Miyoshi is an IBM software developer and Master Inventor in Tokyo, who is currently engaged in IBM Spectrum Archive development. He joined IBM in 2001 with a master’s degree in Electrical Science at Waseda University and has been developing various storage products, such as RAID subsystems, BladeCenter storage and switch, TS7700, SONAS, and IBM Spectrum Scale. His areas of expertise include HSM (Hierarchical Storage Management) with tapes, distributed file system, DR solution for scalable storage systems, and RAS features, such as resource monitoring and Call Home.
Thanks to the following people for their contributions and support for this project:

Atsushi Abe
Hiroshi Araki
Hiroshi Itagaki
Takehiko Ishimoto
Osamu Matsumiya
Hironobu Nagura
IBM Systems

Thanks to the authors of the previous editions of the IBM Spectrum Archive EE Redbooks:

Illarion Borisevich, Larry Coyne, Chris Hoffmann, Stefan Neff, Khanh Ngo, Wei Zheng Ong, Markus Schaefer

Now you can become a published author, too!

Here’s an opportunity to spotlight your skills, grow your career, and become a published author—all at the same time! Join an ITSO residency project and help write a book in your area of expertise, while honing your experience using leading-edge technologies. Your efforts will help to increase product acceptance and customer satisfaction, as you expand your network of technical contacts and relationships. Residencies run from two to six weeks in length, and you can participate either in person or as a remote resident working from your home base.
Find out more about the residency program, browse the residency index, and apply online at this website:

Comments welcome

Your comments are important to us!

We want our books to be as helpful as possible. Send us your comments about this book or other IBM Redbooks publications in one of the following ways:

► Use the online Contact us review Redbooks form found at:
  http://www.ibm.com/redbooks

► Send your comments in an email to:
  redbooks@us.ibm.com

► Mail your comments to:
  IBM Corporation, International Technical Support Organization
  Dept. HYTD Mail Station P099
  2455 South Road
  Poughkeepsie, NY 12601-5400

Summary of changes

This section describes the technical changes that are made in this edition of the book and in previous editions. This edition might also include minor corrections and editorial changes that are not identified.

Summary of Changes
for SG24-8333-07
for IBM Spectrum Archive Enterprise Edition V1.3.0.6: Installation and Configuration Guide
as created or updated on February 11, 2020.

February 2020, Eighth Edition Version 1.3.0.6

New information Version 1.3.0.6

- Supports the enable/disable control of certain tasks by type.
- Supports the assignment of TCP/UDP ports that IBM Spectrum Archive uses within a certain range.
- Supports FC/SAS port load balancing.
- Supports the syslog-ng facility.
- Supports a multi-node upgrade by using a single “ltfsee_install” command.
  - ltfsee_install --upgrade --all
- Supports the following new eeadm commands:
  - eeadm cluster set/show
  - eeadm drive up/down
  - eeadm drive set/show
- Enhanced the tape drive status indication.
- Adds the following new options to the existing eeadm commands:
  - eeadm MIGRATE --premigrate
  - eeadm LIST --migrate, --premigrate, --save, and --recall
- Changed the eeadm reclaim command behavior when only a pool is specified as the reclaim target.
- Renamed some of the eeadm reclaim command options.

New information Version 1.3.0.4

- Performance improvements of eeadm migrate command and eeadm recall --resident command

New information Version 1.3.0.3

- Improved the eeadm cluster stop command to complete more quickly
- IBM Spectrum Archive Enterprise Edition can be configured to use the IBM Spectrum Scale admin network, rather than the daemon network.
- IBM Spectrum Archive Enterprise Edition can be configured without SAN zoning in a multi-server configuration.
- Enhanced the eeadm migrate, eeadm premigrate and eeadm save commands to accept a list of files from stdin or from an input file.

### Changed Information
- Updated RHEL supported levels and IBM Spectrum Scale levels
- Updated the required software
- Added the description of ports used by IBM Spectrum Archive
- Added the description of disabling/enabling the transparent recalls
- Updated recommended inode size
- Added limitation of file path length
- Updated REST API definition
- Renamed LE+ component to LE component
- All examples and references have been updated with the new CLI syntax changes and output. Added online help description for the eeadm CLI command.
- Removed chapter about upgrading from 1.1.x

### April 2019, Seventh Edition Version 1.3.0

#### New information Version 1.3.0
- User Task Control and Reporting: Usability enhancements with new command-line interface (CLI) with more support for monitoring the progress and results of user operations and for tape maintenance
  - Active/Completed task listing including detailed information and output of command
  - Task results including file state transition results
  - Ability to run the command in background, with **--async** option
- Supports the Storage Networking Industry Association’s LTFS format specification 2.4
- Expanded storage capacity with the TS1160 tape drive
- Supports the IBM Spectrum Scale backup function (mmbackup) for the same file system managed by IBM Spectrum Archive
- Bundles the open source package for external monitoring of IBM Spectrum Archive through a GUI/dashboard
- Usage of /dev/sgX device (lin_tape device driver is no longer required to be installed)

### Changed Information
- Updated RHEL supported levels, and IBM Spectrum Scale levels
- All examples and references have been updated with the new CLI syntax changes and output

### June 2018, Sixth Edition Version 1.2.6

#### New information Version 1.2.6
- Added support for IBM Power Server in Little Endian Mode (Power8 8 or later)
Library replacement procedure phase two
Tape intermix in pool for technology upgrade
Datamigrate command for technology upgrade

Changed Information
Updated RHEL supported levels and IBM Spectrum Scale levels
Updated various examples to include new information

January 2018, Fifth Edition Version 1.2.5.1

New information Version 1.2.5.1
- Provides new tape media support for LTO 8 tape drives with LTO 8 Type M cartridge (M8). The LTO program introduced a new capability with LTO 8 tape drives: the ability to write 9 TB (native) on a brand new LTO Ultrium 7 cartridge instead of 6 TB (native) as specified by the LTO 7 format.
- Added support for Red Hat Enterprise Linux Server 7.4.

New information Version 1.2.5
- Provides support for the new 12 TB LTO 8 tape drive and TS1155 FC tape drive in the TS3500 tape library
- A library replacement procedure has been provided to allow the replacing of an old tape library (for example, TS3500 tape library) with a new tape library (for example, TS4500 tape library)

Changed Information
- Upgraded the HSM component to version 8.1.2

August 2017, Fourth Edition Version 1.2.4

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

New information
- Added support for Active File Management (AFM) Independent Writer (IW) mode starting with IBM Spectrum Archive v1.2.3.0 and later
- Added support for a RESTful API
- Added high availability features:
  - Control node failover
  - Monitoring daemon
  - New start/stop
- Added a GUI dashboard for data monitoring
- Added low pool threshold attribute for pools
- Added support for 15 TB tape support with TS1155 tape drive
- Added new ltfsee node show command
- Added new ltfsee failover command
- Added new IBM Spectrum Archive EE database backup
- Added IBM Swift HLM support

**Changed Information**
- Added new traps to SNMP
- Updated ltfsee info nodes command

**February 2017, Third Edition Version 1.2.2 minor update**

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

- Added the following link for the new Performance white paper information in section 3.4.3, “Performance” on page 47.

  **Note:** For more information about migration performance, see see *IBM Spectrum Archive Enterprise Edition v1.2.2 Performance*, WP102688.

- Updated the following examples: Example 6-60 on page 147, Example 6-62 on page 148, Example 6-63 on page 149, Example 6-64 on page 152, Example 6-66 on page 155, Example 7-7 on page 218, Example 7-8 on page 218, Example 7-9 on page 219, Example 7-20 on page 231.

**January 2017, Third Edition Version 1.2.2**

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

**New information**
The following topics are new in Version 1.2.2:

- Added new write failure state, Write Fenced
- Added new pool remove option, -E for removing tapes with no file references
- Increased stability and performance
- Improved export/import
- Improved reconcile
- Automated the recover process of write failure tapes
- Added improved method for recovering read failure tapes

**Changed information**
The following information was changed from the previous edition:

- Added performance section
- Renamed “Recovering data from a write-failure tape” to 6.16, “Reconciliation” on page 171
- Updated the ltfsee recover command in 10.1, “Command-line reference” on page 282
- Added section about recovering data from write failure tapes
- Added section about recovering data from read failure tapes
August 2016, Second Edition Version 1.2.1

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

New information
What’s New in Version 1.2.1:
- Added procedures for upgrading from IBM Spectrum Archive Enterprise Edition version 1.1.x
- Added support for Red Hat Enterprise Linux (RHEL) 6 and Linux Enterprise Server 11
- Added information about avoiding errors during an upgrade on multiple nodes in 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58

Changed information
- Removed commands for creating a list of files to use with migration, premigration, and save functions. v1.2.1.x and later now only uses the IBM GPFS scan result file.
- Updated the options for the `ltfsee_install` command.

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

New information
What’s New in Version 1.2:
- Multiple tape library attachment (up to two) support to a single IBM Spectrum Scale cluster:
  - Data replication to the pools in separate libraries for added data resiliency.
  - You can use the read replica policy to specify file recall behavior if there is a failure.
  - Total capacity expansion beyond a single library limit.
  - IBM Spectrum Scale cluster in single site or across metro distance locations through IBM Spectrum Scale synchronous mirroring.
  - Mixed type library support with different drive types.
- Pools can be configured with a subset of tapes in one tape library as an LTO tape pool, 3592 tape pool, or 3592 write-once, read-many (WORM) tape pool.

• Data recording on WORM tape cartridges:
  - WORM cartridges are great for long-term records retention applications.
  - Support for 3592 WORM cartridges (3592-JY and 3592-JZ tapes).
  - Selection of rewritable or WORM cartridges per tape pool.
  - Files can be migrated (or premigrated) to the specified WORM pool as the destination in the IBM Spectrum Scale policy file or CLI option.
  - Files on WORM tapes will not be overwritten and are not erasable:
    • Reclamation, reconciliation, and reformat operations are disabled.
    • As a preferred practice, set the immutable flag on IBM Spectrum Scale disk to prevent the deletion of stub file for more data protection.

• Expand storage capacity with LTO7 support:
  - You have 2.4 - 4 times the capacity in the same footprint compared to LTO6 and LTO5 technology.
  - Support for migration of files larger than 2.x TB (up to 6.x TB).
  - Intermixing of LTO generation in single library is supported (the pool must be homogeneous).

• Performance improvement for large-scale systems:
  - Optimization of file migration operations for many small files and for multi-node configuration.
  - Reduced IBM Spectrum Scale file system size requirements for IBM Spectrum Archive EE metadata.
  - Collocation of files within a pool for speedier file recall.

• Flexibility in pool-based data management:
  - Improved automatic recovery process on failure by switching to replica pools.
  - Improved support of tape drive intermix.

January 2015, Third Edition Version 1.1.1.2

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below.

New information
- Added support for IBM GPFS V4.1
- Added support for IBM TS1150 tape drive and media
- v1.1.1.2 (PGA2.1) updates

Changed information
Added the -u option to the reconcile command to skip the pretest that checks for the necessity to reconcile before mounting the tapes.
November 2014, Second Edition Version 1.1.1.1

This revision reflects the addition, deletion, or modification of new and changed information, which is summarized below:

**New information**

- Premigration commands
- Added support for IBM TS4500 and TS3310 tape libraries
- More operating system platform support
- Preserving file system objects on tape
- Recall commands
- Version 1.1.1.0 (PGA1) and Version 1.1.1.1 (PGA2) updates

**Changed information**

- Improved small file migration performance
- Improved data resiliency (All copies are now referenced.)
IBM Spectrum Archive Enterprise Edition

This chapter introduces the IBM Spectrum Archive Enterprise Edition (formerly IBM Linear Tape File System™ Enterprise Edition [LTFS EE]) and describes its business benefits, general use cases, technology, components, and functions.

This chapter includes the following topics for IBM Spectrum Archive Enterprise Edition (EE):

- 1.1, “Introduction” on page 2
- 1.2, “IBM Spectrum Archive EE functions” on page 6
- 1.3, “IBM Spectrum Archive EE components” on page 9
- 1.4, “IBM Spectrum Archive EE cluster configuration introduction” on page 14
1.1 Introduction

IBM Spectrum Archive, a member of the IBM Spectrum Storage™ family, enables direct, intuitive, and graphical access to data stored in IBM tape drives and libraries by incorporating the LTFS format standard for reading, writing, and exchanging descriptive metadata on formatted tape cartridges. IBM Spectrum Archive eliminates the need for more tape management and software to access data.

IBM Spectrum Archive offers three software solutions for managing your digital files with the LTFS format: Single Drive Edition (SDE), Library Edition (LE), and Enterprise Edition (EE). This book focuses on the IBM Spectrum Archive EE.

IBM Spectrum Archive EE provides seamless integration of LTFS with IBM Spectrum Scale, which is another member of the IBM Spectrum Storage family, by creating a tape-based storage tier. You can run any application that is designed for disk files on tape by using IBM Spectrum Archive EE because it is fully transparent and integrates in the IBM Spectrum Scale file system. IBM Spectrum Archive EE can play a major role in reducing the cost of storage for data that does not need the access performance of primary disk.

With IBM Spectrum Archive EE, you can enable the use of LTFS for the policy management of tape as a storage tier in an IBM Spectrum Scale environment and use tape as a critical tier in the storage environment.

The use of IBM Spectrum Archive EE to replace online disk storage with tape in tier 2 and tier 3 storage can improve data access over other storage solutions because it improves efficiency and streamlines management for files on tape. IBM Spectrum Archive EE simplifies the use of physical tape by making it not apparent to the user and manageable by the administrator under a single infrastructure.

Figure 1-1 shows the integration of an IBM Spectrum Archive EE archive solution.

![IBM Spectrum Archive and IBM Spectrum Scale Tape Tier](image-url)
IBM Spectrum Archive EE uses the IBM Spectrum Archive LE for the movement of files to and from tape devices. The scale-out architecture of IBM Spectrum Archive EE can add nodes and tape devices as needed to satisfy bandwidth requirements between IBM Spectrum Scale and the IBM Spectrum Archive EE tape tier.

Low-cost storage tier, data migration, and archive needs that are described in the following use cases can benefit from IBM Spectrum Archive EE:

- **Operational storage**
  Provides a low-cost, scalable tape storage tier.

- **Active archive**
  A local or remote IBM Spectrum Archive EE node serves as a migration target for IBM Spectrum Scale that transparently archives data to tape that is based on policies set by the user.

The following IBM Spectrum Archive EE characteristics cover a broad base of integrated storage management software with leading tape technology and the highly scalable IBM tape libraries:

- Integrates with IBM Spectrum Scale by supporting file-level migration and recall with an innovative database-less storage of metadata.
- Provides a scale-out architecture that supports multiple IBM Spectrum Archive EE nodes that share tape inventory with load balancing over multiple tape drives and nodes.
- Enables tape cartridge pooling and data exchange for IBM Spectrum Archive EE tape tier management:
  - Tape cartridge pooling allows the user to group data on sets of tape cartridges.
  - Multiple copies of files can be written on different tape cartridge pools, including different tape libraries in different locations.
  - Supports tape cartridge export with and without the removal of file metadata from IBM Spectrum Scale.
  - Supports tape cartridge import with pre-population of file metadata in IBM Spectrum Scale.

Furthermore, IBM Spectrum Archive EE provides the following key benefits:

- **A low-cost storage tier in an IBM Spectrum Scale environment.**
- **An active archive or big data repository for long-term storage of data that requires file system access to that content.**
- **File-based storage in the LTFS tape format that is open, self-describing, portable, and interchangeable across platforms.**
- **Lowers capital expenditure and operational expenditure costs by using cost-effective and energy-efficient tape media without dependencies on external server hardware or software.**
- **Allows the retention of data on tape media for long-term preservation (10+ years).**
- **Provides the portability of large amounts of data by bulk transfer of tape cartridges between sites for disaster recovery and the initial synchronization of two IBM Spectrum Scale sites by using open-format, portable, self-describing tapes.**
- **Migration of data to newer tape or newer technology that is managed by IBM Spectrum Scale.**
> Provides ease of management for operational and active archive storage.
> Expand archive capacity simply by adding and provisioning media without affecting the availability of data already in the pool.

**Tip:** For a no-cost trial version of the IBM Spectrum Archive EE, contact your local IBM sales representative.

1.1.1 Operational storage

This section describes how IBM Spectrum Archive EE is used as a storage tier in an IBM Spectrum Scale environment.

Using an IBM Spectrum Archive tape tier as operational storage is useful when a significant portion of files on a disk storage system infrastructure is static, meaning the data is not changing.

In this case, as shown in Figure 1-2, it is optimal to move the content to a lower-cost storage tier, in this case a physical tape. The files that are migrated to the IBM Spectrum Archive EE tape tier remain online, meaning they are accessible from the IBM Spectrum Scale file system under the IBM Spectrum Scale namespace at any time. Tape cartridge pools within IBM Spectrum Archive EE can also be used for backup.

![Figure 1-2  Tiered operational storage with IBM Spectrum Archive EE managing the tape tier](image)
With IBM Spectrum Archive EE, the user specifies files to be migrated to the IBM Spectrum Archive tape tier by using standard IBM Spectrum Scale scan policies. IBM Spectrum Archive EE then manages the movement of IBM Spectrum Scale file data to the IBM Spectrum Archive tape cartridges. It also edits the metadata of the IBM Spectrum Scale files to point to the content on the IBM Spectrum Archive tape tier.

Access to the migrated files through the IBM Spectrum Scale file system remains unchanged, with the file data provided at the data rate and access times of the underlying tape technology. The IBM Spectrum Scale namespace is unchanged after migration, making the placement of files in the IBM Spectrum Archive tape tier not apparent to users and applications. See 7.10.1, “Creating a traditional archive system policy” on page 217.

### 1.1.2 Active archive

This section describes how IBM Spectrum Archive EE is used as an active archive in an IBM Spectrum Scale environment.

The use of an LTFS tape tier as an active archive is useful when you need a low-cost, long-term archive for data that is maintained and accessed for reference. IBM Spectrum Archive satisfies the needs of this type of archiving by using open-format, portable, and self-describing tapes based on the LTFS standard.

In an active archive, the IBM Spectrum Archive file system is the main store for the data while the IBM Spectrum Scale file system, with its limited disk capacity, is used as a staging area, or cache, in front of IBM Spectrum Archive EE. IBM Spectrum Scale policies are used to stage and de-stage data from the IBM Spectrum Scale disks to the IBM Spectrum Archive EE tape cartridge.

Figure 1-3 shows the archive storage management with the IBM Spectrum Archive tape tier in the IBM Spectrum Scale file system, the disk that is used for caching, and the namespace that is mapped to the tape cartridge pool.

![Figure 1-3  Archive storage management with IBM Spectrum Archive EE](image)
The tapes from the archive can be exported for vaulting or for moving data to another location. Because the exported data is in the LTFS format, it can be read on any LTFS-compatible system.

For more information see 7.10.2, “Creating active archive system policies” on page 218.

1.2 IBM Spectrum Archive EE functions

This section describes the main functions that are found within IBM Spectrum Archive EE. Figure 1-4 shows where IBM Spectrum Archive EE fits within the solution architecture that integrates with IBM Spectrum Archive LE and IBM Spectrum Scale. This integration enables the functions of IBM Spectrum Archive to represent the external tape cartridge pool to IBM Spectrum Scale and file migration based on IBM Spectrum Scale policies. IBM Spectrum Archive EE can be configured on multiple nodes with those instances of IBM Spectrum Archive EE sharing a physical tape library.

With IBM Spectrum Archive EE, you can perform the following management tasks on your system:

- Create and define tape cartridge pools for file migrations.
- Migrate files in the IBM Spectrum Scale namespace to the IBM Spectrum Archive tape tier.
- Recall files that were migrated to the IBM Spectrum Archive tape tier back into IBM Spectrum Scale.
- Reconcile file inconsistencies between files in IBM Spectrum Scale and their equivalents in IBM Spectrum Archive.
- Reclaim tape space that is occupied by non-referenced files and non-referenced content that is present on the physical tapes.
- Export tape cartridges to remove them from your IBM Spectrum Archive EE system.
- Import tape cartridges to add them to your IBM Spectrum Archive EE system.
- Add tape cartridges to your IBM Spectrum Archive EE system to expand the tape cartridge pool with no disruption to your system.
- Obtain inventory, job, and scan status of your IBM Spectrum Archive EE solution.
1.2.1 User Task Reporting

Versions prior to IBM Spectrum Archive EE v1.3.0.0 reported any running or pending operations through the `ltfsee info scans` and `ltfsee info jobs` commands. However any successes or failures of prior commands, history of operations, or output of commands cannot be seen except through examination of the trace logs. Furthermore, the result of any file state changes from any migration, premigration, or recall commands cannot be viewed.

IBM Spectrum Archive EE v1.3.0.0 introduces the concept of user tasks. A user task is defined as follows:

- User initiated command or operation where each is considered a single task
- Each task will be uniquely identified by a task ID in the range of 1,000 to 99,999 with the next task ID after 99,999 starting back at 1,000
- A maximum number of tasks that can be accepted is defined as follows:
  - 128 transparent recalls per each active control node
  - For tasks other than transparent recall, 512 tasks for each active control node
- If a task cannot be accepted due to this limit, the command will be rejected immediately without assigning a task ID
- Task(s) can be manually cleared for any completed tasks
- The last 10 tasks with errors will always be preserved unless manually cleared

The following commands and operations create user tasks:

- `eedm migrate`
- `eedm premigrate`
- `eedm recall`
- `eedm save`
- `eedm drive down`
- `eedm drive unassign`
- `eedm drive up`
- `eedm tape assign`
- `eedm tape datamigrate`
- `eedm tape export`
- `eedm tape import`
- `eedm tape move`
- `eedm tape offline`
- `eedm tape online`
- `eedm tape reclaim`
- `eedm tape reconcile`
- `eedm tape unassign`
- `eedm tape validate`
- `eedm task clearhistory`

The current user task features are:

- A task which is currently being processed or will be processed is defined as an “active” task. An “active” task status can be in one of the following:
  - interrupted: The task was running but currently not running due to other higher priority tasks such as recall tasks
  - running: The task is running using at least 1 tape cartridge in 1 tape drive resource
  - waiting: The task is created but is not running yet (pending to run)
A task which has been processed is defined as a “completed” task. A “completed” task status can be in one of the following:

- aborted: The task was running but a control node failover occurred. The task needs to be manually resubmitted
- failed: The task completed with one or more errors
- succeeded: The task completed with a success (no errors)

List active tasks and completed tasks including the following information:

- Task ID
- Type
- Status
- Number of drives used for the task
- Created time
- Started time

Show details of active tasks and completed tasks within the last 3 months including the following information:

- Task ID
- Type
- Command and parameters
- Status
- Result
- Accepted time
- Started time
- Completed time
- In-use resources for pool(s), tape drive(s), and tape cartridge(s)
- Workload
- Progress

Show file results (success or failure) for any completed migration, premigration, or recall tasks

Support an **--async** option which allows the task to be started asynchronously (i.e. when specified, the command returns immediately with the task ID after the request has been issued and the status of the command can be monitored later). It should be used on longer running commands where the administrator does not want to wait for it’s completion. Using the **--async** option, the administrator can start the command, later query the status of the command using the `eeadm task list` command and finally review detailed information using the `eeadm task show` command. The following commands support this **--async** option:

- `eeadm drive down`
- `eeadm drive unassign`
- `eeadm drive up`
- `eeadm tape export`
- `eeadm tape import`
- `eeadm tape assign`
- `eeadm tape unassign`
- `eeadm tape datamigrate`
- `eeadm tape reclaim`
- `eeadm tape reconcile`
- `eeadm tape validate`
- `eeadm tape move`
- `eeadm task clearhistory`
- `eeadm task cancel`
1.3 IBM Spectrum Archive EE components

This section describes the components that make up IBM Spectrum Archive EE:

- EE components: Multi-tape management module (MMM) and Monitoring Daemon (MD)
- Library Edition (LE) component
- Hierarchy Storage Management (HSM) component

IBM Spectrum Scale is a required component for the IBM Spectrum Archive solution.

IBM Spectrum Archive EE is composed of multiple components that enable an IBM Spectrum Archive tape tier to be used for migration and recall with the IBM Spectrum Scale. Files are migrated to, and recalled from, the IBM Spectrum Archive tape tier by using the IBM Spectrum Archive EE components that are shown in Figure 1-5 on page 10 and Figure 1-6 on page 11.

1.3.1 IBM Spectrum Archive EE terms

An IBM Spectrum Archive EE solution consists of the following components:

- IBM Spectrum Archive EE node
  An x86_64 IBM Spectrum Scale server that is running on IBM Spectrum Archive EE. Each EE node must be connected to a set of tape drives in a tape library, through an FC connection. One EE node cannot be connected to more than one logical library.

- IBM Spectrum Archive EE Cluster
  A set of EE nodes that are connected to a single IBM Spectrum Scale cluster. All nodes in a cluster can see the files on the IBM Spectrum Scale file system with the same inode number.
  IBM Spectrum Scale clusters that are connected by active file management (AFM) are considered as two separate IBM Spectrum Scale clusters by IBM Spectrum Archive EE.

- IBM Spectrum Scale Cluster
  IBM Spectrum Scale servers (non-EE nodes) and EE nodes.

- IBM Spectrum Scale only Node
  An IBM Spectrum Scale server that is running on a supported platform, such as Linux or Microsoft Windows, without IBM Spectrum Archive EE.

- Tape Pool
  A set of tape cartridges of the same type (either Write Once Read Many (WORM) or Non-WORM, and either LTO or 3592) that are in one logical tape library. A tape pool uses the same generation of tapes within the pool.
  A tape pool does not span across multiple tape libraries.
  A tape pool is assigned to only one node group.
Node Group

Nodes that are connected to the same tape library. Normally there is a one-to-one relationship between a node group and a tape library, so a dual-library EE cluster has two node groups, at minimum. In theory, you can divide one tape library into multiple node groups, just like partitioning.

Tape pools are assigned to only one node group, but a node group can access multiple tape pools.

Control Node

An EE node that is running in an MMM. IBM Spectrum Archive EE v1r2 and subsequent releases require you to configure one control node per tape library. The control node manages all the requests for access to its associated tape library. The control node redirects requests for access to other tape libraries to the control nodes of the other tape libraries.

Figure 1-5 shows the components that make up IBM Spectrum Archive EE. The components are shown with IBM Spectrum Scale configured on separate nodes for maximum scalability.

Figure 1-5  Components of IBM Spectrum Archive EE with separate IBM Spectrum Scale nodes
In Figure 1-6, the components that make up IBM Spectrum Archive EE are shown with no separate IBM Spectrum Scale nodes. Also shown is how IBM Spectrum Scale can be configured to run on the same nodes as the IBM Spectrum Archive EE nodes.

A second tape library can be added to the configuration, which expands the storage capacity and offers the opportunity to add nodes and tape devices. Availability can be improved by storing redundant copies on different tape libraries.

With multiple tape library attachments, the tape libraries can be connected to an IBM Spectrum Scale cluster in a single site or can be placed in the metro distance locations through IBM Spectrum Scale synchronous mirroring (stretched cluster).

The following distances are supported for stretched cluster with synchronous mirroring using block-level replication:

- For V4.2.2.3 and later, distances greater than 300 km (186.4 miles)
- For V4.2.1 and later, distances up to 300 km (186.4 miles)
- For V4.2 and previous, distances less than 100 km (62 miles)

For more information, see IBM Knowledge Center.

It is important to remember that this is still a single IBM Spectrum Scale cluster. In a configuration using IBM Spectrum Scale replication, a single IBM Spectrum Scale cluster is defined over two geographically separated sites consisting of two active production sites and by using tiebreaker disks.

One or more file systems are created, mounted, and accessed concurrently from the two active production sites. The data and metadata replication features of IBM Spectrum Scale are used to maintain a secondary copy of each file system block, relying on the concept of disk failure groups to control the physical placement of the individual copies:

1. Separate the set of available disk volumes into two failure groups. Define one failure group at each of the active production sites.
2. Create a replicated file system. Specify a replication factor of 2 for both data and metadata.

When allocating new file system blocks, IBM Spectrum Scale always assigns replicas of the same block to distinct failure groups. This feature provides a sufficient level of redundancy, allowing each site to continue operating independently should the other site fail. For more information about synchronous mirroring that uses IBM Spectrum Scale replication, see IBM Knowledge Center.

**Important:** Stretched cluster is available for distances of 100 km (62 miles) - 300 km (186.4 miles). For longer distances, use the AFM feature of IBM Spectrum Scale with IBM Spectrum Archive.

With the release of IBM Spectrum Archive v1.2.3.0, limited support is provided for IBM Spectrum Scale AFM. The only supported AFIs with two different IBM Spectrum Scale clusters with one instance of IBM Spectrum Archive at each site.

For more information about IBM Spectrum Scale AFM, see 2.2.5, “Active File Management” on page 32.

For more information, see IBM Knowledge Center.

Figure 1-7 shows a fully configured IBM Spectrum Archive EE.

---

**1.3.2 Hierarchical Storage Manager**

A Hierarchical Storage Manager (HSM) solution typically moves the file’s data to back-end storage (in most cases, physical tape media) and leaves a small stub file in the local storage file system. The stub file uses minimal space, but leaves all metadata information about the local storage in such a way that for a user or a program the file looks like a normal, local
stored file. When the user or a program accesses the file, the HSM solution automatically recalls (moves back) the file’s data from the back-end storage and gives the reading application access to the file when all the data is back retrieved and available online again.

### 1.3.3 Multi-Tape Management Module

This component is a service of IBM Spectrum Archive EE control node. The MMM service implements policy-based tape cartridge selection and maintains the state of all of the resources that are available in the system. There is one control node per tape library.

The scheduler component of the control node uses policy-based cartridge selection to schedule and process job requests, such as migration and recall requests, which are fulfilled by using available system nodes and tape resources. The following tasks are done by the scheduler:

- Choosing a job from the job queue
- Choosing an appropriate tape cartridge and tape drive to handle the work
- Starting the job

The control node also manages the creation of replicas across multiple tape libraries. For example, when the `eeadm migrate` command specifies making replicas of files in multiple tape libraries, the command accesses the control node that manages the tape pool for the primary copy.

The control node puts the copy job in the job queue for the primary tape library, then passes the secondary copy job to the control node for the second tape library. The second control node puts the copy job in the job queue for the second tape library.

When the scheduler component of the control node selects a tape cartridge and tape drive for a migration job, it manages the following conditions:

- If the migration is to a tape cartridge pool, the tape drive must belong to the node group that owns the tape cartridge pool.
- If a format generation property is defined for a tape cartridge pool, the tape cartridge must be formatted as that generation, and the tape drive must support that format.
- The number of tape drives that are being used for migration to a tape cartridge pool at one time must not exceed the defined mount limit.
- If there are multiple candidate tapes available for selection, the scheduler tries to choose a tape cartridge that is already mounted on an available tape drive.

When the scheduler selects a tape cartridge and tape drive for jobs other than migration, it makes the following choices:

- Choosing an available tape drive in the node group that owns the tape cartridge and tape cartridge pool
- Choosing the tape drive that has the tape drive attribute for the job

When the control node scheduler selects a tape cartridge for transparent recalls such as double-clicks or application reads, it manages the following conditions:

- If the file has a replica, the scheduler always chooses the primary copy. The first tape cartridge pool that is used by the migration process contains the primary copy.
- If the primary copy cannot be accessed, the scheduler automatically retries the recall job by using the other replicas if available.

Other functions that are provided by the control node include the following functions:
▶ Maintains a catalog of all known drives that are assigned to each IBM Spectrum Archive node in the system
▶ Maintains a catalog of tape cartridges in the tape library/libraries
▶ Maintains an estimate of the free space on each tape cartridge
▶ Allocates space on tape cartridges for new data

The MMM service is started when IBM Spectrum Archive EE is started by running the `eeadm cluster start` command. The MMM service runs on only one IBM Spectrum Archive EE control node at a time. Several operations, including migration and recall, fail if the MMM service stops. If SNMP traps are enabled, a notification is sent when the MMM service starts or stops.

For more information, see 6.4, “Starting and stopping IBM Spectrum Archive EE” on page 125, and 6.24, “Monitoring the system with SNMP” on page 191.

**Important:** If the `eeadm cluster start` command does not return after several minutes, it might be because the firewall is running. The firewall service must be disabled on the IBM Spectrum Archive EE nodes. For more information, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

The `eeadm cluster start` command also does the unmount of the tape drives, so the process might take a long time if there are many mounted tape drives.

### 1.3.4 IBM Spectrum Archive Library Edition component

The IBM Spectrum Archive Library Edition (LE) component is the IBM Spectrum Archive tape tier of IBM Spectrum Archive EE. The LE is configured to work with the EE.

The LE component is installed on all of the IBM Spectrum Scale nodes that are connected to the IBM Spectrum Archive EE library. It is the migration target for IBM Spectrum Scale. The LE component accesses the recording space on the physical tape cartridges through its file system interface and handles the user data as file objects and associated metadata in its namespace.

With IBM Spectrum Archive EE v1.2.4.0 and later, IBM Spectrum Archive LE is started automatically when running the `eeadm cluster start` command. If errors occur during start of the IBM Spectrum Archive EE system, run the `eeadm node list` command to display which component failed to start.

For more information about the updated `eeadm node list` command, see 6.7, “IBM Spectrum Archive EE automatic node failover” on page 131.

### 1.4 IBM Spectrum Archive EE cluster configuration introduction

This section describes a cluster configuration for IBM Spectrum Archive EE. This configuration is for single-library, multiple-node access.

Single-library, multiple-node access enables access to the same set of IBM Spectrum Archive EE tape cartridges from more than one IBM Spectrum Archive EE node. The purpose of
enabling this capability is to improve data storage and retrieval performance by assigning fewer tape drives to each node.

When this cluster configuration is used, each IBM Spectrum Archive EE node must have its own set of drives that is not shared with any other node. In addition, each IBM Spectrum Archive EE node must have at least one control path drive that is designated as a control path by an operator of the attached IBM tape library.

IBM Spectrum Archive EE uses the drive that is designated as a control path to communicate with the tape library. This type of control path is also known as a media changer device. IBM Spectrum Archive EE is scalable so you can start out with a single node and add more nodes later.

Important: As part of your planning, work with your IBM tape library administrator to ensure that each IBM Spectrum Archive EE node in your configuration has its own media changer device (control path) defined in its logical library.

Figure 1-8 shows the typical setup for an IBM Spectrum Archive EE single-library, multiple-node access.

IBM Spectrum Archive EE manages all aspects of the single-library, multiple-node access, which includes the management of the following areas:

- Multiple tenancy
The contents of the tape cartridge are managed automatically by the IBM Spectrum Archive EE system so that each IBM Spectrum Archive EE node does not have to be aware of any changes made on other IBM Spectrum Archive EE nodes. The index on each tape cartridge is updated when the tape is mounted and the index is read from this tape.

- **Single node management of library inventory**
  
The IBM Spectrum Archive EE system automatically keeps the library inventory up to date to manage the available drives and tape cartridges. The library inventory is kept on the node on which the MMM service runs.

- **Space reclaim management**
  
  When data is moved from one tape cartridge to another to reclaim the space on the first tape cartridge, the IBM Spectrum Archive EE system ensures that the internal database reflects the change in the index of the IBM Spectrum Archive physical tape cartridge.
IBM Spectrum Archive overview

This chapter provides an overview of the IBM Spectrum Archive product family and the individual components of the IBM Spectrum Archive Enterprise Edition (EE).

This chapter includes the following topics:

- 2.1, “Introduction to IBM Spectrum Archive and LTFS” on page 18
- 2.2, “IBM Spectrum Scale” on page 28
- 2.3, “OpenStack SwiftHLM” on page 33
- 2.4, “IBM Spectrum Archive EE dashboard” on page 35
- 2.5, “IBM Spectrum Archive EE REST API” on page 37
- 2.6, “Types of archiving” on page 37
2.1 Introduction to IBM Spectrum Archive and LTFS

LTFS is the first file system that works with LTO tape technology and IBM Enterprise tape drives, providing ease of use and portability for open systems tape storage.

Note: Throughout this publication, the terms supported tape libraries, supported tape drives, and supported tape media are used to represent the following tape libraries, tape drives, and tape media. Unless otherwise noted, as of the date of publication, IBM Spectrum Archive EE supports these libraries:

- IBM TS4500 tape library
- IBM TS4300 tape library
- IBM TS3500 tape library
- IBM TS3310 tape library
- IBM LTO Ultrium 8, 7, 6, or 5 tape drives, and IBM TS1160, TS1155, TS1150, or TS1140 tape drives
- LTO Ultrium 8, M8, 7, 6, and 5, and 3592 JM, JE, JV, JC, JB, JD, JK, and JL tape media

For more information about the latest system requirements, see IBM Knowledge Center.

For the latest IBM Spectrum Archive Library Edition Support Matrix (supported tape library and tape drive firmware levels, see IBM Support’s Fix Central web page.

a. IBM TS1160, TS1155, TS1150, and IBM TS1140 support on IBM TS4500 and IBM TS3500 tape libraries only
b. Uninitialized M8 media (MTM 3589-452) is only supported on the following tape libraries in IBM Spectrum Archive EE: TS4500, TS4300, and TS3310. TS3500 will only support pre-initialized media.

With this application, accessing data that is stored on an IBM tape cartridge is as easy and intuitive as the use of a USB flash drive. Tapes are self-describing, and you can quickly recall any file from a tape cartridge without having to read the whole tape cartridge from beginning to end. Furthermore, any LTFS-capable system can read a tape cartridge that is created by any other LTFS-capable system (regardless of the operating system). Any LTFS-capable system can identify and retrieve the files that are stored on it. LTFS-capable systems have the following characteristics:

- Files and directories are shown to you as a directory tree listing.
- More intuitive searches of tape cartridges and library content are now possible because of the addition of file tagging.
- Files can be moved to and from LTFS tape cartridges by using the familiar drag method that is common to many operating systems.
- Many applications that were written to use files on disk can now use files on tape cartridges without any modification.
- All standard File Open, Write, Read, Append, Delete, and Close functions are supported.
- No need for another external tape management system or database tracking the content of each tape.
Archival data storage requirements are growing at over 60% annually. The LTFS format is an ideal option for long-term archiving of large files that must be easily shared with others. This option is especially important because the tape media that it uses (LTO and 3592) are designed to have a 15 - 30 year lifespan (depending on the number of read/write passes).

Industries that most benefit from this tape file system are the banking, digital media, medical, geophysical, and entertainment industries. Many users in these industries use Linux or Macintosh systems, which are fully compatible with LTFS.

LTO Ultrium tape cartridges from earlier LTO generations (that is, LTO-1 through LTO-4) cannot be partitioned and be used by LTFS/IBM Spectrum Archive. Also, if LTO Ultrim 4 tape cartridges are used in an LTO Ultrim 5 tape drive to write data, the LTO-4 tape cartridge is treated as an unpartitioned LTO-5 tape cartridge. Even if an application can manage partitions, it is not possible to partition the LTO-4 media that is mounted in an LTO Ultrim 5 drive.

Starting with the release of IBM Spectrum Archive EE v1r2, corresponding Write Once, Read Many (WORM) tape cartridges are supported in an IBM Spectrum Archive EE solution operating supported IBM Enterprise tape drives. With the same release, tape drives in mixed configurations are supported. For more information, see 6.21, “Tape drive intermix support” on page 183.

Although LTFS presents the tape cartridge as a disk drive, the underlying hardware is still a tape cartridge and is therefore sequential in nature. Tape does not allow random access. Data is always appended to the tape, and there is no overwriting of files. File deletions do not erase the data from tape, but instead erase the pointers to the data. So, although with LTFS you can simultaneously copy two (or more) files to an LTFS tape cartridge, you get better performance if you copy files sequentially.

To operate the tape file system, the following components are needed:

- Software in the form of an open source LTFS package
- Data structures that are created by LTFS on tape

Together, these components can manage a file system on the tape media as though it is a disk file system for accessing tape files, including the tape directory tree structures. The metadata of each tape cartridge, after it is mounted, is cached in server memory. Therefore, metadata operations, such as browsing the directory or searching for a file name, do not require any tape movement and are quick.
### 2.1.1 Tape media capacity with IBM Spectrum Archive

Table 2-1 lists the tape drives and media that are supported by LTFS. The table also gives the native capacity of supported media, and raw capacity of the LTFS data partition on the media.

a. WORM media are not supported by IBM Spectrum Archive SDE and IBM Spectrum Archive LE, only with EE.

b. The actual usable capacity is greater when compression is used.

c. See the topic Data storage values, found at [https://www.ibm.com/support/knowledgecenter/en/STQNYL_2.4.0/ltfs_data_storage_values.html](https://www.ibm.com/support/knowledgecenter/en/STQNYL_2.4.0/ltfs_data_storage_values.html).

d. Values that are given are the default size of the LTFS data partition, unless otherwise indicated.

e. TS1160, TS1155, TS1150, and TS1140 tape drives support enhanced partitioning for cartridges.

f. Media that are formatted on a 3592 drive must be read on the same generation of drive. For example, a JC cartridge that was formatted by a TS1150 tape drive cannot be read on a TS1140 tape drive.
2.1.2 Comparison of the IBM Spectrum Archive products

The following sections give a brief overview of the IBM Spectrum Archive software products that are available at the time of writing. Their main features are summarized in Table 2-2.

Note: IBM LTFS Storage Manager (LTFS SM) was discontinued from marketing effective 12/14/2015. IBM support for the LTFS SM still continues.

Table 2-2  LTFS product comparison

2.1.3 IBM Spectrum Archive Single Drive Edition

The IBM Spectrum Archive SDE provides direct, intuitive, and graphical access to data that is stored with the supported IBM tape drives and libraries that use the supported Linear Tape-Open (LTO) Ultrium tape cartridges and IBM Enterprise tape cartridges. It eliminates the need for more tape management and software to access data. The LTFS format is the first file system that works with tape technology that provides ease of use and portability for open systems tape storage. With this system, accessing data that is stored on an IBM tape cartridge is as easy and intuitive as using a USB flash drive.

Note: For in-depth information about IBM Spectrum Archive Single Drive Edition, see *IBM Linear Tape File System Installation and Configuration*, SG24-8090.
Figure 2-1 shows the IBM Spectrum Archive SDE user view, which resembles standard file folders.

![IBM Spectrum Archive SDE user view showing the file folders from the single LTFS tape cartridge](image)

Figure 2-1  IBM Spectrum Archive SDE user view showing the file folders from the single LTFS tape cartridge

It runs on Linux, Windows, and MacOS, and with the operating system’s graphical File Manager, reading data on a tape cartridge is as easy as dragging file data sets. Users can run any application that is designed for disk files against tape data without concern for the fact that the data is physically stored on tape. IBM Spectrum Archive SDE allows access to all of the data in a tape cartridge that is loaded on a single drive as though it were on an attached disk drive.

It supports existing stand-alone versions of LTFS, such as those running on IBM, HP, Quantum, FOR-A, 1 Beyond, and other platforms.

**IBM Spectrum Archive SDE software, systems, tape drives and media requirements**

The most current software, systems, tape drives and media requirements can be found at the IBM Spectrum Archive Single Drive Edition IBM Knowledge Center website.

Select the most current IBM Spectrum Archive SDE version and then select Planning. The Supported tape drives and media, system requirements, and required software topics are displayed.

IBM Spectrum Archive SDE supports the use of multiple tape drives at one time. The method for using multiple tape drives depends on the operating system being used.

For Linux and Mac OS X users, it is possible to use multiple tape drives by starting multiple instances of the LTFS software, each with a different target tape device name in the `-o devname` parameter. For more information, see the topic *Mounting media by using the ltfs command*, at IBM Knowledge Center.

For Windows users, the LTFS software detects each of the installed tape drives, and it is possible to assign a different drive letter to each drive by using the configuration window. For more information, see the topic *Assigning a drive letter to a tape drive*, at IBM Knowledge Center.
Note: A certain level of tape drive firmware is required to fully use IBM Spectrum Archive SDE functions. To find the supported firmware version and for more information about connectivity and configurations, see the IBM System Storage™ Interoperation Center (SSIC) web page.

**Migration path to IBM Spectrum Archive EE**

There is no direct migration path from IBM Spectrum Archive SDE to IBM Spectrum Archive EE software. Any existing IBM Spectrum Archive SDE software should be uninstalled before IBM Spectrum Archive EE is installed. Follow the uninstallation procedure that is documented in the *IBM Linear Tape File System Installation and Configuration*, SG24-8090.

Data tapes that are used by IBM Spectrum Archive SDE version 1.3.0 or later can be imported into IBM Spectrum Archive EE. For more information about this procedure, see 6.19.1, “Importing” on page 177. Tapes that were formatted in LTFS 1.0 format by older versions of IBM Spectrum Archive are automatically upgraded to LTFS 2.0 format on first write.

### 2.1.4 IBM Spectrum Archive Library Edition

IBM Spectrum Archive LE uses the open, non-proprietary LTFS format that allows any application to write files into a large archive. It provides direct, intuitive, and graphical access to data that is stored on tape cartridges within the supported IBM tape libraries that use either LTO IBM Enterprise supported tape drives.

**Note:** For in-depth information about IBM Spectrum Archive Library Edition see the *IBM Linear Tape File System Installation and Configuration*, SG24-8090.

Figure 2-2 shows the user view of multiple IBM Spectrum Archive tapes appearing as different library folders.

![Figure 2-2](image-url)  
*Figure 2-2 IBM Spectrum Archive LE User view of multiple LTFS tape cartridges*

In addition, IBM Spectrum Archive LE enables users to create a single file system mount point for a logical library that is managed by a single instance of IBM Spectrum Archive, which runs on a single computer system.
The LTFS metadata of each tape cartridge, after it is mounted, is cached in server memory. So, even after the tape cartridge is ejected, the tape cartridge metadata information remains viewable and searchable, with no remounting required. Every tape cartridge and file is accessible through the operating system file system commands, from any application. This improvement in search efficiency can be substantial, considering the need to search hundreds or thousands of tape cartridges that are typically found in tape libraries.

**IBM Spectrum Archive LE software, systems, tape drives and media requirements**

The most current software, systems, tape drives and media requirements can be found at the IBM Spectrum Archive Library Edition IBM Knowledge Center website.

Select the most current IBM Spectrum Archive LE version and then select **Planning**. The Supported tape drives and media, system requirements, and required software topics will be displayed.

For more information about connectivity and configurations, see the **SSIC website**.

**Migration path to IBM Spectrum Archive EE**

There is no direct migration path from IBM Spectrum Archive LE to IBM Spectrum Archive EE software. Any existing IBM Spectrum Archive LE software should be uninstalled before IBM Spectrum Archive EE is installed. Follow the uninstall procedure that is documented in *IBM Linear Tape File System Installation and Configuration*, SG24-8090.

Data tapes that were created and used by IBM Spectrum Archive LE Version 2.1.2 or later can be imported into IBM Spectrum Archive EE. For more information about this procedure, see 6.19.1, “Importing” on page 177.

### 2.1.5 IBM Spectrum Archive Enterprise Edition

As enterprise-scale data storage, archiving, and backup expands, there is a need to lower storage costs and improve manageability. IBM Spectrum Archive EE provides such a solution that offers IBM Spectrum Scale users a new low-cost, scalable storage tier.

IBM Spectrum Archive EE provides seamless integration of LTFS with IBM Spectrum Scale by providing an IBM Spectrum Archive tape tier under IBM Spectrum Scale. IBM Spectrum Scale policies are used to move files between online disks storage and IBM Spectrum Archive tape tiers without affecting the IBM Spectrum Scale namespace.

IBM Spectrum Archive EE uses IBM Spectrum Archive LE for the movement of files to and from the physical tape devices and cartridges. IBM Spectrum Archive EE can manage multiple IBM Spectrum Archive LE nodes in parallel, so bandwidth requirements between IBM Spectrum Scale and the tape tier can be satisfied by adding nodes and tape devices as needed.
Figure 2-3 shows the IBM Spectrum Archive EE system view with IBM Spectrum Scale providing the global namespace and IBM Spectrum Archive EE installed on two IBM Spectrum Scale nodes. IBM Spectrum Archive EE can be installed on one or more IBM Spectrum Scale nodes. Each IBM Spectrum Archive EE instance has dedicated tape drives that are attached in the same tape library partition. IBM Spectrum Archive EE instances share tape cartridges and LTFS index. The workload is distributed over all IBM Spectrum Archive EE nodes and their attached tape drives.

![Figure 2-3  IBM Spectrum Archive EE system view](image)

A local or remote IBM Spectrum Archive LE node serves as a migration target for IBM Spectrum Scale, which transparently archives data to tape based on policies set by the user.

IBM Spectrum Archive EE provides the following benefits:

- A low-cost storage tier in an IBM Spectrum Scale environment.
- An active archive or big data repository for long-term storage of data that requires file system access to that content.
- File-based storage in the LTFS tape format that is open, self-describing, portable, and interchangeable across platforms.
- Lowers capital expenditure and operational expenditure costs by using cost-effective and energy-efficient tape media without dependencies on external server hardware or software.
- Provides unlimited capacity scalability for the IBM supported tape libraries and keeping offline tape cartridges on shelves.
- Allows the retention of data on tape media for long-term preservation (10+ years).
> Provides the portability of large amounts of data by bulk transfer of tape cartridges between sites for disaster recovery and the initial synchronization of two IBM Spectrum Scale sites by using open-format, portable, self-describing tapes.

> Provides ease of management for operational and active archive storage.

Figure 2-4 provides a conceptual overview of processes and data flow in IBM Spectrum Archive EE.

![IBM Spectrum Archive EE data flow](image)

IBM Spectrum Archive EE can be used for a low-cost storage tier, data migration, and archive needs as described in the following use cases.

**Operational storage**

The use of an IBM Spectrum Archive tape tier as operational storage is useful when a significant portion of files on an online disk storage system is static, meaning the data does not change. In this case, it is more efficient to move the content to a lower-cost storage tier, for example, to a physical tape cartridge. The files that are migrated to the IBM Spectrum Archive tape tier remain online, meaning they are accessible at any time from IBM Spectrum Scale under the IBM Spectrum Scale namespace.

With IBM Spectrum Archive EE, the user specifies files to be migrated to the IBM Spectrum Archive tape tier by using standard IBM Spectrum Scale scan policies. IBM Spectrum Archive EE then manages the movement of IBM Spectrum Scale file data to IBM Spectrum Archive tape cartridges. It also edits the metadata of the IBM Spectrum Scale files to point to the content on the IBM Spectrum Archive tape tier.

Access to the migrated files through the IBM Spectrum Scale file system remains unchanged with the file data provided at the data rate and access times of the underlying tape technology. The IBM Spectrum Scale namespace is unchanged after migration, which makes the placement of files in the IBM Spectrum Archive tape tier not apparent to users and applications.
Active archive
The use of an IBM Spectrum Archive tape tier as an active archive is useful when there is a need for a low-cost, long-term archive for data that is maintained and accessed for reference. IBM Spectrum Archive satisfies the needs of this type of archiving by using open-format, portable, self-describing tapes. In an active archive, the LTFS-file system is the main storage for the data. The IBM Spectrum Scale file system, with its limited disk capacity, is used as a staging area, or cache, in front of IBM Spectrum Archive.

IBM Spectrum Scale policies are used to stage and destage data from the IBM Spectrum Scale disks space to the IBM Spectrum Archive tape cartridges. The tape cartridges from the archive can be exported for vaulting or for moving data to another location. Because the exported data is in the LTFS format, it can be read on any LTFS-compatible system.

History of the IBM Spectrum Archive EE releases
The following list shows you the evolution and releases of the IBM Spectrum Archive EE software since going to market in the year 2013:

- Version 1.R1.0.0 (GA in 6/2013)
- Version 1.R1.1.0 (1/2014) as pGA 1
- Version 1.R1.1.1 (6/2014) as pGA 2
- Version 1.R1.1.2 (12/2014) as pGA 2.1
- Version 1.R1.1.3 (3/2015) as pGA 2.2
- Version 1.R1.2.0 (5/2015) for the IBM Spectrum Archive renaming
- Version 1.R2.0.0 (12/2015)
- Version 1.R2.1.0 (6/2016)
- Version 1.R2.2.0 (12/2016)
- Version 1.R2.3.0 (3/2017)
- Version 1.R2.4.0 (6/2017)
- Version 1.R2.5.0 (11/2017)
- Version 1.R2.6.0 (3/2018)
- Version 1.R3.0.0 (12/2018)

Note: pGA stands for post-GA releases of IBM software or products. The pGA releases usually contain a set of selected fixes. In this case, there are enhancements and some new product function and features.

2.2 IBM Spectrum Scale

IBM Spectrum Scale is a cluster file system solution, which means that it provides concurrent access to one or more file systems from multiple nodes. These nodes can all be SAN-attached, network-attached, or both, which enables high-performance access to this common set of data to support a scale-out solution or provide a high availability platform.

The entire file system is striped across all storage devices, typically disk and flash storage subsystems.

Note: IBM Spectrum Scale is a member of the IBM Spectrum product family. The most recent version at the time of writing is Version 5.0.2.0. Version 4.1.1 was the first version with the name IBM Spectrum Scale. The prior versions, Versions 4.1.0 and 3.5.x, are still called GPFS. Both IBM Spectrum Scale and GPFS are used interchangeably in this book.
2.2.1 Overview

IBM Spectrum Scale can help you achieve Information Lifecycle Management (ILM) efficiencies through powerful policy-driven automated tiered storage management. The IBM Spectrum Scale ILM toolkit helps you manage sets of files, pools of storage, and automate the management of file data. By using these tools, IBM Spectrum Scale can automatically determine where to physically store your data regardless of its placement in the logical directory structure. Storage pools, file sets, and user-defined policies can match the cost of your storage resources to the value of your data.

You can use IBM Spectrum Scale policy-based ILM tools to perform the following tasks:

- Create storage pools to provide a way to partition a file system’s storage into collections of disks or a redundant array of independent disks (RAID) with similar properties that are managed together as a group.

  IBM Spectrum Scale has the following types of storage pools:

  - A required system storage pool that you create and manage through IBM Spectrum Scale.
  - Optional user storage pools that you create and manage through IBM Spectrum Scale.
  - Optional external storage pools that you define with IBM Spectrum Scale policy rules and manage through an external application, such as IBM Spectrum Archive EE.

- Create file sets to provide a way to partition the file system namespace to allow administrative operations at a finer granularity than that of the entire file system.

- Create policy rules that are based on data attributes to determine initial file data placement and manage file data placement throughout the life of the file.

2.2.2 Storage pools

Physically, a storage pool is a collection of disks or RAID arrays. You can use storage pools to group multiple storage systems within a file system. By using storage pools, you can create tiers of storage by grouping storage devices based on performance, locality, or reliability characteristics. For example, one pool can be an enterprise class storage system that hosts high-performance FC disks and another pool might consist of numerous disk controllers that host a large set of economical SATA disks.

There are two types of storage pools in an IBM Spectrum Scale environment: Internal storage pools and external storage pools. Internal storage pools are managed within IBM Spectrum Scale. External storage pools are managed by an external application, such as IBM Spectrum Archive EE. For external storage pools, IBM Spectrum Scale provides tools that you can use to define an interface that IBM Spectrum Archive EE uses to access your data.

IBM Spectrum Scale does not manage the data that is placed in external storage pools. Instead, it manages the movement of data to and from external storage pools. You can use storage pools to perform complex operations such as moving, mirroring, or deleting files across multiple storage devices, which provide storage virtualization and a single management context.
Internal IBM Spectrum Scale storage pools are meant for managing online storage resources. External storage pools are intended for use as near-line storage and for archival and backup operations. However, both types of storage pools provide you with a method to partition file system storage for the following considerations:

- Improved price-performance by matching the cost of storage to the value of the data
- Improved performance by:
  - Reducing the contention for premium storage
  - Reducing the impact of slower devices
  - Allowing you to retrieve archived data when needed
- Improved reliability by providing for:
  - Replication based on need
  - Better failure containment
  - Creation of storage pools as needed

### 2.2.3 Policies and policy rules

IBM Spectrum Scale provides a means to automate the management of files by using policies and rules. If you correctly manage your files, you can use and balance efficiently your premium and less expensive storage resources. IBM Spectrum Scale supports the following policies:

- File placement policies are used to place automatically newly created files in a specific storage pool.
- File management policies are used to manage files during their lifecycle by moving them to another storage pool, moving them to near-line storage, copying them to archival storage, changing their replication status, or deleting them.

A policy is a set of rules that describes the lifecycle of user data that is based on the file's attributes. Each rule defines an operation or definition, such as migrate to a pool and replicate the file. The rules are applied for the following uses:

- Initial file placement
- File management
- Restoring file data

When a file is created or restored, the placement policy determines the location of the file's data and assigns the file to a storage pool. All data that is written to that file is placed in the assigned storage pool. The placement policy that is defining the initial placement of newly created files and the rules for placement of restored data must be installed into IBM Spectrum Scale by running the `mmchpolicy` command. If an IBM Spectrum Scale file system does not have a placement policy that is installed, all the data is stored into the system storage pool. Only one placement policy can be installed at a time.

If you switch from one placement policy to another, or change a placement policy, that action has no effect on existing files. However, newly created files are always placed according to the currently installed placement policy.

The management policy determines file management operations, such as migration and deletion. To migrate or delete data, you must run the `mmapplypolicy` command. You can define the file management rules and install them in the file system together with the placement rules. As an alternative, you can define these rules in a separate file and explicitly provide them to `mmapplypolicy` by using the `-P` option. In either case, policy rules for placement or migration can be intermixed. Over the life of the file, data can be migrated to a different storage pool any number of times, and files can be deleted or restored.
With Version 3.1, IBM Spectrum Scale introduced the policy-based data management that automates the management of storage resources and the data that is stored on those resources. Policy-based data management is based on the storage pool concept. A storage pool is a collection of disks or RAIDs with similar properties that are managed together as a group. The group under which the storage pools are managed together is the file system.

IBM Spectrum Scale provides a single name space across all pools. Files in the same directory can be in different pools. Files are placed in storage pools at creation time by using placement policies. Files can be moved between pools based on migration policies and files can be removed based on specific policies.

For more information about the SQL-like policy rule language, see *IBM Spectrum Scale: Administration Guide*, which is available at IBM Knowledge Center.

IBM Spectrum Scale V3.2 introduced external storage pools. You can set up external storage pools and GPFS policies that allow the GPFS policy manager to coordinate file migrations from a native IBM Spectrum Scale online pool to external pools in IBM Spectrum Archive EE. The GPFS policy manager starts the migration through the HSM client command-line interface embedded in the IBM Spectrum Archive EE solution.

For more information about GPFS policies, see 6.11, “Migration” on page 143.

### 2.2.4 Migration or premigration

The migration or premigration candidate selection is identical to the IBM Spectrum Scale native pool-to-pool migration/premigration rule. The Policy Engine uses the `eemadm migrate` or `eemadm premigrate` command for the migration or premigration of files from a native storage pool to an IBM Spectrum Archive EE tape cartridge pool.

There are two different approaches that can be used to drive an IBM Spectrum Archive EE migration through GPFS policies: Manual and automated. These approaches are only different in how the `mmapplypolicy` command (which performs the policy scan) is started.

#### Manual

The manual IBM Spectrum Scale driven migration is performed when the user or a UNIX cron job runs the `mmapplypolicy` command with a predefined migration or premigration policy. The rule covers the migration or premigration of files from the system pool to the external IBM Spectrum Scale pool, which means that the data is physically moved to the external tape pool, which must be defined in IBM Spectrum Archive EE.

#### Automated

The GPFS threshold migration is performed when the user specifies a threshold policy and the GPFS policy daemon is enabled to monitor the storage pools in the file system for that threshold. If a predefined high threshold is reached (which means the filling level of the storage pool reached the predefined high water mark), the monitor daemon automatically starts the `mmapplypolicy` command to perform an inode scan.

For more information about migration, see 6.11, “Migration” on page 143.
2.2.5 Active File Management

IBM Spectrum Scale Active File Management (AFM) is a scalable, high-performance file-system caching layer that is integrated with the IBM Spectrum Scale cluster file system. AFM is based on a home-cache model. A single home provides the primary file storage that is exported. One or more caches provide a view into the exported home file system without storing the file data locally. Upon file access in the cache, the data is fetched from home and stored in cache.

Another way to get files transferred from home to cache is through prefetching. Prefetching can use the IBM Spectrum Scale policy engine to quickly identify files that match certain criteria.

When files are created or changed in cache, they can be replicated back to home. A file that was replicated back to home can be evicted in cache. In this case, the user still sees the file in cache (the file is uncached), but the actual file content is stored in home. Eviction is triggered by the quota that is set on the AFM file set and can evict files based on size or last recent used criteria.

Cache must be an IBM Spectrum Scale independent file set. Home can be an IBM Spectrum Scale file system, a Network File System (NFS) export from any other file system, or a file server (except for the disaster-recovery use case). The caching relationship between home and cache can be based on the NFS or native IBM Spectrum Scale protocol. In the latter case, home must be an IBM Spectrum Scale file system in a different IBM Spectrum Scale cluster. The examples in this Redpaper that feature AFM use an NFS protocol at the home cluster.

The AFM relation is typically configured on the cache file set in one specific mode. The AFM mode determines where files can be processed (created, updated, and deleted) and how files are managed by AFM according to the file state. See Figure 2-5 on page 33 for AFM file states.

**Important:** IBM Spectrum Archive EE V1.2.3.0 is the first release that started supporting IBM Spectrum Scale AFM with IBM Spectrum Scale V4.2.2.3. AFM has multiple cache modes that can be created. However, IBM Spectrum Archive EE only supports the independent-writer (IW) cache mode. More cache modes might be supported soon.

**Independent-writer**

AFM’s IW cache mode makes the AFM target home for one or more caches. All changes in the caches are replicated to home asynchronously. Changes to the same data are applied in the home file set so that the changes are replicated from the caches. There is no cross-cache locking. Potential conflicts must be resolved at the respective cache site.
A file in the AFM cache can have different states as shown in Figure 2-5. File states can be different depending on the AFM modes.

![AFM file state transitions](image)

**Figure 2-5  AFM file state transitions**

### Uncached
When an AFM relation is created between cache and home, and files are available in home, these files can be seen in cache without being present. This state means that the file metadata is present in the cache, but the file content is still on home. Such files are in status uncached. In addition, the uncached status is achieved by evicting files from the cache.

### Cached
When an uncached file is accessed in cache for a read or write operation, the file is fetched from home. Fetching is the process of copying a file from home to cache. Files fetched from home to cache are in cached state. Another way to fetch files from home to cache is by using the AFM prefetch command (`mmafmctl prefetch`). This command can use the policy engine to identify files quickly, according to certain criteria.

### Dirty
When a cached file in the AFM cache is modified, that file is marked as dirty, indicating that it is a candidate for replication back to home. The dirty status of the file is reset to cached if the file has been replicated to home. When a file is deleted in cache, this delete operation is also done on home.

For information about how to configure AFM with IBM Spectrum Archive EE, see 7.10.3, “IBM Spectrum Archive EE migration policy with AFM” on page 220. For use cases, see 8.9, “AFM use cases” on page 256.

### 2.3 OpenStack SwiftHLM

The Swift High Latency Media (SwiftHLM) project seeks to create a high-latency storage back end that makes it easier for users to perform bulk operations of data tiering within a Swift data ring. SwiftHLM enables IBM Spectrum Scale, IBM Spectrum Archive, and IBM Spectrum Protect as the key products for this software-defined hybrid storage with object interface to tape technology. Data is produced at significantly higher rates than a decade ago.

The storage and data management solutions of the past can no longer keep up with the data demands of today. The policies and structures that decide and execute how that data is used, discarded, or retained determines how efficiently the data is used. The need for intelligent data management and storage is more critical now than ever before.
Traditional management approaches hide cost-effective, high-latency media (HLM) storage, such as tape or optical disk archive back ends, underneath a traditional file system. The lack of HLM-aware file system interfaces and software makes it difficult for users to understand and control data access on HLM storage. Coupled with data-access latency, this lack of understanding results in slow responses and potential timeouts that affect the user experience.

The Swift HLM project addresses this challenge. Running OpenStack Swift on top of HLM storage allows you to cheaply store and efficiently access large amounts of infrequently used object data. Data that is stored on tape storage can be easily adopted to an Object Storage data interface. SwiftHLM can be added to OpenStack Swift (without modifying Swift) to extend Swift’s interface.

This ability allows users to explicitly control and query the state (on disk or on HLM) of Swift object data, including efficient pre-fetch of bulk objects from HLM to disk when those objects must be accessed. This function, previously missing in Swift, provides similar functions as Amazon Glacier does through the Glacier API or the Amazon S3 Lifecycle Management API.

BDT Tape Library Connector (open source) and IBM Spectrum Archive or IBM Spectrum Protect™ are examples of HLM back ends that provide important and complex functions to manage HLM resources (tape mounts and unmounts to drives, serialization of requests for tape media, and tape drive resources). They can use SwiftHLM functions for a proper integration with Swift.

Although access to data that is stored on HLM can be done transparently without the use of SwiftHLM, this process does not work well in practice for many important use cases and other reasons. SwiftHLM function can be orthogonal and complementary to Swift (ring to ring) tiering (source). The high-level architecture of the low cost, high-latency media storage solution is shown in Figure 2-6 on page 35.

For more information, see Implementing OpenStack SwiftHLM with IBM Spectrum Archive EE or IBM Spectrum Protect for Space Management, REDP-5430.
2.4 IBM Spectrum Archive EE dashboard

IBM Spectrum Archive EE provides dashboard capabilities that allow customers to visualize their data through a graphical user interface (GUI). By using the dashboard, you can see the following things without logging in to a system and typing commands by using a web-browser:

- See whether a system is running without error. If there is an error, see what kind of error is detected.
- See basic tape-related configurations like how many pools and how much space is available.
- See time-scaled storage consumption for each tape pool.
- See the throughput for each drive for migration and recall.
- See current running/waiting tasks

This monitoring feature consists of multiple components that are installed in the IBM Spectrum Archive EE nodes as well as dedicating an external node for displaying the dashboard.

The dashboard consists of the following components:

- Logstash
- Elasticsearch
- Grafana
Logstash is used for data collection, and should be installed on all IBM Spectrum Archive EE nodes. The data that is collected by Logstash is then sent to Elasticsearch on the external monitoring node where it can query data quickly and send it to the Grafana component for visualization. Figure 2-7 shows the IBM Spectrum Archive EE Dashboard architecture.

![IBM Spectrum Archive Dashboard architecture](image)

Figure 2-7   IBM Spectrum Archive Dashboard architecture

The Dashboard views are System Health, Storage, Activity, Config, and Task. Figure 2-8 shows an example of the IBM Spectrum Archive EE Dashboard Activity view.

![IBM Spectrum Archive EE Dashboard activity view](image)

Figure 2-8   IBM Spectrum Archive EE Dashboard activity view

For more information on configuring the Dashboard within your environment, see the *IBM Spectrum Archive Enterprise Edition Dashboard Deployment Guide*, which is available at IBM Knowledge Center.
2.5 IBM Spectrum Archive EE REST API

The Representational State Transfer (REST) API for IBM Spectrum Archive Enterprise Edition can be used to access data on the IBM Spectrum Archive Enterprise Edition system. Starting with Version 1.2.4, IBM Spectrum Archive EE provides the configuration information through its REST API. The GET operation returns the array of configured resources similar to CLI commands, but in well-defined JSON format.

They are equivalent to what the `eeadm task list` and `eeadm task show` commands display. With the REST API, you can automate these queries and integrate the information into your applications including the web/cloud.

For installation instructions, see 4.4, “Installing a RESTful server” on page 64.

For usage examples including commonly used parameters, see 6.26, “IBM Spectrum Archive REST API” on page 194.

2.6 Types of archiving

It is important to differentiate between archiving and the HSM process that is used by IBM Spectrum Archive EE. When a file is migrated by IBM Spectrum Archive EE from your local system to tape storage, a placeholder or stub file is created in place of the original file. Stub files contain the necessary information to recall your migrated files and remain on your local file system so that the files appear to be local. This process contrasts with archiving, where you often delete files from your local file system after archiving them.

The following types of archiving are used:

- Archive with no file deletion
- Archive with deletion
- Archive with stub file creation (HSM)
- Compliant archiving

Archiving with no file deletion is the typical process that is used by many backup and archive software products. In the case of IBM Spectrum Protect, an archive creates a copy of one or more files in IBM Spectrum Protect with a set retention period. It is often used to create a point-in-time copy of the state of a server’s file system and this copy is kept for an extended period. After the archive finishes, the files are still on the server’s file system.

Contrast this with archiving with file deletion where after the archive finishes the files that form part of the archive are deleted from the file system. This is a feature that is offered by the IBM Spectrum Protect archive process. Rather than a point-in-time copy, it can be thought of as a point-in-time move as the files are moved from the servers’ file system into IBM Spectrum Protect storage.

If the files are needed, they must be manually retrieved back to the file system. A variation of this is active archiving, which is a mechanism for moving data between different tiers of storage depending on its retention requirements. For example, data that is in constant use is kept on high-performance disk drives, and data that is rarely referenced or is required for long-term retention is moved to lower performance disk or tape drives.

IBM Spectrum Archive EE uses the third option, which instead of deleting the archived files, it creates a stub file in its place. If the files are needed, they are automatically retrieved back to the file system by using the information that is stored in the stub file when they are accessed.
The final type of archiving is compliant archiving, which is a legislative requirement of various countries and companies data retention laws, such as Sarbanes-Oxley in the US. These laws require a business to retain key business information. Failure to comply with these laws can result in fines and sanctions. Essentially, this type of archiving results in data being stored by the backup software without the possibility of it being deleted before a defined period elapses. In certain cases, it can never be deleted.

**Important:** IBM Spectrum Archive EE is not a compliant archive solution.
Planning

This chapter provides planning information that is related to the IBM Spectrum Archive Enterprise Edition (EE). Review the Planning section within the IBM Spectrum Archive EE IBM Knowledge Center website.

The most current information for IBM Spectrum Archive EE hardware and software configurations, notices, and limitations can always be found in the readme file of the software package.

This chapter includes the following topics:

▶ 3.1, “System requirements” on page 40
▶ 3.2, “Required software” on page 42
▶ 3.3, “Hardware and software setup” on page 44
▶ 3.4, “Sizing and settings” on page 46
### 3.1 System requirements

IBM Spectrum Archive EE supports the Linux operating systems and hardware platforms that are shown in Table 3-1.

**Table 3-1 Linux system requirements**

<table>
<thead>
<tr>
<th>Linux computers</th>

</tbody>
</table>
3.1.1 Limitations

In this section, we describe the limitations of the files that the IBM Spectrum Archive EE can successfully migrate and save data to tapes.

**Maximum file size**

IBM Spectrum Archive EE cannot split a file into multiple sections and distribute the sections across more than one tape. Therefore, it cannot migrate a file that is larger than the data partition size. For more information about media types and partition sizes, see 2.1.1, “Tape media capacity with IBM Spectrum Archive” on page 20.

**Maximum file name length**

Consider the following points:

- A file cannot be migrated if its full path name (file name length plus path length) exceeds 1024 bytes.
- A file cannot be saved if its full path name (file name length plus path length) exceeds 1022 bytes.

Some limitations exist to the IBM Spectrum Archive EE software that relates to IBM Spectrum Protect™, Scale-out Backup and Recovery (SOBAR), Advanced File Management (AFM), and Transparent Cloud Tiering (TCT).

If IBM Spectrum Protect clients are being used for managing the files in the same IBM Spectrum Scale cluster, the following limitations apply:

- If the IBM Spectrum Protect backup client needs to back up the files of the file system that is managed by IBM Spectrum Archive EE, you must schedule the migration process to start after the files are backed up.

  The new `--mmbackup` option for the `premigrate` and `migrate` commands can be used to ensure the files are backed up first before migration. Otherwise, they would be filtered out when using the `--mmbackup` option. See “Backing up a GPFS or IBM Spectrum Scale environment” on page 237.

- If an IBM Spectrum Scale cluster is used with IBM Spectrum Archive EE, any file system that is in the same IBM Spectrum Scale cluster cannot be used with IBM Spectrum Protect for Space Management for migrating the data to IBM Spectrum Protect servers.

The file system that is managed by IBM Spectrum Archive EE cannot be used with the following functions or features of IBM Spectrum Scale:

- Scale-out Backup and Recovery (SOBAR)
- Advanced File Management (AFM), in a mode other than Independent Writer mode
- Transparent Cloud Tiering (TCT)
## 3.2 Required software

This section describes the required software for IBM Spectrum Archive EE on Red Hat systems. The following RPM Package Manager software (RPMS) must be installed and be at latest levels for a Red Hat Enterprise Linux system before installing IBM Spectrum Archive EE v1.3.0.0.

The x86_64 operating system includes the following prerequisites:

- IBM Spectrum Scale version 4.2.3.6, or 5.0.2.0 or subsequent releases (Standard Edition, Advanced Edition, or Data Management Edition)

| Note: IBM Spectrum Scale version 4.2.3 requires a patch to the installation toolkit when IBM Spectrum Archive Enterprise Edition is installed. |

- pyOpenSSL
- attr
- fuse
- gpfs.base
- gpfs.docs
- gpfs.ext
- gpfs.gpl
- gpfs.msg
- libicu
- libxml2
- net-snmp
- openssl
- python-2.7.5-34 or later, but earlier than 3.0
- rpcbind
- gperftools-libs
- boost-thread
- boost-filesystem
- boost-date-time
- boost-serialization
- boost-program-options
- boost-regex
- fuse-libs
- libuuid
- lsof

| Note: These required RPMS were gathered from an RHEL 7.5 machine. Your RPMS versions might differ depending on the version of your RHEL OS. |
IBM Power server platform (ppc64le) operating system includes the following prerequisites:

- IBM Spectrum Scale version 4.2.3.6, or 5.0.2.0 or subsequent releases (Standard Edition, Advanced Edition, or Data Management Edition)
- pyOpenSSL
- attr
- fuse
- gpfs.base
- gpfs.docs
- gpfs.ext
- gpfs.gpl
- gpfs.msg
- libicu
- libxml2
- net-snmp
- openssl
- python-2.7.5-34 or later, but earlier than 3.0
- rpcbind
- gperftools-libs
- boost-thread
- boost-filesystem
- boost-date-time
- boost-serialization
- boost-program-options
- boost-regex
- fuse-libs
- libuuid
- lsof

Java virtual machine (JVM) 1.7 or later also must be installed before you install IBM Spectrum Archive Enterprise Edition.
3.3 Hardware and software setup

Valid combinations of IBM Spectrum Archive EE components in an IBM Spectrum Scale cluster are listed in Table 3-2.

### Table 3-2 Valid combinations for types of nodes in the IBM Spectrum Scale cluster

<table>
<thead>
<tr>
<th>Node type</th>
<th>IBM Spectrum Scale</th>
<th>IBM Spectrum Archive internal Hierarchical Storage Management (HSM)</th>
<th>IBM Spectrum Archive LE</th>
<th>Multi-tape management module (MMM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IBM Spectrum Scale only node</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>IBM Spectrum Archive EE node</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

All other combinations are invalid as an IBM Spectrum Archive EE system. IBM Spectrum Archive EE nodes have connections to the IBM tape libraries and drives.

Multiple IBM Spectrum Archive EE nodes enable access to the same set of IBM Spectrum Archive EE tapes. The purpose of enabling this capability is to increase the performance of the host migrations and recalls by assigning fewer tape drives to each IBM Spectrum Archive EE node. The number of drives per node depends on the HBA/switch/host combination. The idea is to have the maximum number of drives on the node such that all drives on the node can be writing or reading at their maximum speeds.

The following hardware/software/configuration setup must be prepared before IBM Spectrum Archive EE is installed:

- IBM Spectrum Scale is installed on each of the IBM Spectrum Archive EE nodes.
- The IBM Spectrum Scale cluster is created and all of the IBM Spectrum Archive EE nodes belong to the cluster.

A single NUMA node is preferable for better performance. For servers that contain multiple CPUs, the key is to remove memory from the other CPUs and group them in a single CPU to create a single NUMA node. This configuration allows all the CPUs to access the shared memory, resulting in higher read/write performances between the disk storage and tape storage.

FC switches can be added between the host and tape drives as well as between the host and the disk storage to create a storage area network (SAN) to further expand storage needs as required.

If you plan to configure your own server, an example of a server configuration is listed below for a Lenovo x3650 M5 rack server: Server System x3650 M5 - 8871KXU:

- Intel Xeon Processor E5-2640 v4 10C 2.4 GHz 25 MB Cache 2133 MHz 90 W (Standard)
- 16 GB TruDDR4 Memory (2Rx4, 1.2 V) PC4-19200 CL17 2400 MHz LP RDIMM (Standard) x 4
- ServeRAID M5210 SAS/SATA Controller (Standard)
- System x Enterprise Slides Kit (Standard)
- System x 900 W High Efficiency Platinum AC Power Supply (Standard)
- System x 900 W High Efficiency Platinum AC Power Supply (Standard)
> System x3650 M5 PCIe Riser 1 (1 x16 FH/FL + 1 x8 FH/HL Slots):
  - QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)
  - QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)

> System x3650 M5 PCIe Riser 2 (1 x16 FH/FL + 1 x8 FH/HL Slots):
  - QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)
  - QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)

> x3650 M5 PCIe x8: QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)

> x3650 M5 PCIe x8: QLogic 8 Gb FC Dual-port HBA (16 Gb preferred)

**Note:** Servers with multiple sockets can have the sockets physically removed.

Figure 3-1 provides an example of an IBM Spectrum Archive EE node hardware setup with a x3650 M5 rack server.

*Figure 3-1   IBM Spectrum Archive EE node hardware setup with a x3650 M5 rack server*

**Note:** The example uses a x3650 M5 rack server because all standard models come by default with an Intel Xeon E5-2600 v5 single socket processor with 4 PCIe slots dedicated to the socket. For more information about the x3650 m5 server, see [this website](#).
3.4 Sizing and settings

There are many considerations that are required when you are planning for an IBM Spectrum Scale file system, including the IBM Spectrum Archive EE HSM-managed file system and the IBM Spectrum Archive EE metadata file system. Thus, this section describes the IBM Spectrum Scale file system aspects to help avoid the need to make changes later.

3.4.1 IBM Spectrum Archive EE metadata file system

IBM Spectrum Archive EE requires space for the file metadata that is stored on an IBM Spectrum Scale file system. If this metadata file system is separate from the IBM Spectrum Scale space-managed file systems, you must ensure that the size and number of inodes of the metadata file system is large enough to handle the number of migrated files.

The IBM Spectrum Archive EE metadata directory can be stored in its own IBM Spectrum Scale file system or it can share the IBM Spectrum Scale file system that is being space-managed.

When the IBM Spectrum Archive EE metadata file system is using the same IBM Spectrum Scale file system to be space-managed, it has the advantage of being flexible by sharing the resources. Space-managed and IBM Spectrum Archive EE metadata can accommodate each other by growing and shrinking as needed. Therefore, it is suggested that you use a single file system. For metadata optimization, it is preferable to put the GPFS metadata and the IBM Spectrum Archive metadata on SSDs or a Flash drive.

The size requirements of the IBM Spectrum Scale file system that is used to store the IBM Spectrum Archive EE metadata directory depends on the block size and the number of files that are migrated to IBM Spectrum Archive EE.

The following calculation produces an estimate of the minimum number of inodes that the IBM Spectrum Scale file system must have available. The calculation depends on the number of cartridges:

\[
\text{Number of inodes} = 500 + (15 \times c) \quad \text{(Where } c \text{ is the number of cartridges.)}
\]

**Important:** If there is more than one tape library, the number of cartridges in your calculation must be the total number of cartridges in all libraries.

The following calculation produces an estimate of the size of the metadata that the IBM Spectrum Scale file system must have available:

\[
\text{Number of GBs} = 10 + (3 \times F \times N)
\]

where:

- \( F \) is the number of files, in millions, to migrate.
- \( N \) is the number of replicas to create.

For example, to migrate 50 million files to two tape storage pools, 310 GB of metadata is required:

\[
10 + (3 \times 50 \times 2) = 310 \text{ GB}
\]
3.4.2 Redundant copies

The purpose of redundant copies is to enable the creation of multiple LTFS copies of each GPFS file during migration. One copy is considered to be the primary, and the other copies are considered the redundant copies. The redundant copies can be created only in pools that are different from the pool of the primary copy and different from the pools of other redundant copies. The maximum number of redundant copies is two. The primary copy and redundant copies can be in a single tape library or spread across two tape libraries.

Thus, to ensure that file migration can occur on redundant copy tapes, the number of tapes in the redundant copy pools must be the same or greater than the number of tapes in the primary copy pool. For example, if the primary copy pool has 10 tapes, the redundant copy pools also should have at least 10 tapes. For more information about redundant copies, see 6.11.4, “Replicas and redundant copies” on page 155.

**Note:** The most commons setup is to have two copies, that is, one primary and one copy pool with the same number of tapes.

3.4.3 Performance

Performance planning is an important aspect of any IBM Spectrum Archive EE implementation, specifically migration performance. The migration performance is the rate at which IBM Spectrum Archive EE can move data from disk to tape, freeing up space on disk. The number of tape drives (including tape drive generation) and servers that are required for the configuration can be determined based on the amount of data that needs to be moved per day and an estimate of the average file size of that data.

**Note:** Several components of the reference architecture affect the overall migration performance of the solution, including backend disk speeds, SAN connectivity, NUMA node configuration, and amount of memory. Thus, this migration performance data should be used as a guideline only and any final migration performance measurements should be done on the actual customer hardware.

For more migration performance information, see *IBM Spectrum Archive Enterprise Edition v1.2.2 Performance*, WP102688.
The configuration that is shown in Figure 3-2 was used to run the lab performance test in this section.

![IBM Spectrum Archive EE configuration used in lab performance](image)

**Figure 3-2   IBM Spectrum Archive EE configuration used in lab performance**

The performance data shown in this section was derived by using two x3850 X5 servers consisting of multiple QLogic QLE2562 8 Gb FC HBA cards. The servers were also modified by moving all the RAM memory to a single CPU socket to create a multi-CPU, single NUMA node. The HBAs were relocated so they are on one NUMA node.

This modification was made so that memory can be shared locally to improve performance. The switch used in the lab was an IBM 2498 model B40 8 Gb FC switch that was zoned out so that it had a zone for each HBA in each node. An IBM Storwize® V7000 disk storage unit was used for the disk space and either TS1150 or TS1070 drives were used in a TS4500 tape library.

Figure 3-2 shows the example configuration. This is one of many configurations. Yours might be different.
Figure 3-3 shows a basic internal configuration of Figure 3-2 in more detail. The two x3850 X5 servers are using a single NUMA and have all the HBAs performing out of it. This configuration allows all CPUs within the servers to work more efficiently. The 8 GB Fibre Channel switch is broken up so that each zone handles a single HBA on each server.

![Diagram of two nodes running off NUMA 0 connected to an 8 Gb switch with four drives per node and one external storage unit](image)

**Note:** Figure 3-3 shows a single Fibre Channel cable going to the drive zones. However, generally you should have a second Fibre Channel cable for failover scenarios. This is the same reason why the zone that goes to the external storage unit has two Fibre Channel cables from 1 HBA on each server.

This diagram should be used as a guide on how you would set up your own environment for best performances. This is one of many configurations. For instance, if you have more drives, you can add more tape drives per zone, or add more HBAs on each server and create a new zone.
Table 3-3 and Table 3-4 list the raw data of total combined transfer rate in MiB/s on multiple node configurations with various file sizes (the combined transfer rate of all drives). In these tables, N represents nodes, D represents number of drives per node, and T represents the total number of drives for the configuration.

With a TS1150 configuration of 1N4D4T, you can expect to see a combined total transfer rate of 1244.9 MBps for 10 GiB files. If that configuration is doubled to 2N4D8T, the total combined transfer rate is nearly doubled to 2315.3 MiB/s for 10 GiB files. With this information, you can estimate the total combined transfer rate for your configuration.

Table 3-3  TS1150 raw performance data for multiple node/drive configurations with 5 MiB, 10 MiB, 1 GiB, and 10 GiB files

<tr>
<td>2 Drives (1N2D2T)</td>
<td>111.0</td>
</tr>
</tbody>
</table>
Figure 3-4 shows a comparison line graph of the raw performance data obtain for TS1150 drives and LTO7 drives that use the same configurations. It is clear that using small files, the comparison between the two types of drives is minimal. However, when migrating file sizes of 1 GiB and greater, there is a noticeable difference. Comparing the biggest configuration of 2N4D8T, the LTO peaks at a total combined transfer rate of 1921.7 MiB/s. With the same configuration but with TS1150 drives, it peaks at a total combined transfer rate of 2315.3 MiB/s.

![Figure 3-4](image)

**Figure 3-4**  Comparison between TS1150 and LTO-7 drives using multiple node/drive configurations

### 3.4.4 Ports that are used by IBM Spectrum Archive EE

In addition to SSH, the software components of IBM Spectrum Archive Enterprise Edition use several TCP/UDP ports for inter-process communication within and among nodes.

The used ports are listed in Table 3-5.

**Table 3-5**  Ports used by IBM Spectrum Archive EE

<table>
<thead>
<tr>
<th>Used port number</th>
<th>Required node</th>
<th>Component using the ports</th>
</tr>
</thead>
<tbody>

Several other ports are used by HSM. For more information, see IBM Knowledge Center.
Chapter 4. Installation

This chapter provides information about the distribution and installation of IBM Spectrum Archive Enterprise Edition (EE). It describes the following main aspects:

- Installing IBM Spectrum Archive EE on a Linux system
  This section describes how to install the IBM Spectrum Archive EE program on a Linux system (in our example, we use a Red Hat-based Linux server system). It describes the installation routine step-by-step and reviews the prerequisites.

- Quick installation guide for IBM Spectrum Archive EE
  This optional section provides some background information about how to upgrade the tape library or tape drive firmware for use with the IBM Spectrum Archive EE.

This chapter includes the following topics:

- 4.1, “Installing IBM Spectrum Archive EE on a Linux system” on page 54
- 4.2, “Installation prerequisites for IBM Spectrum Archive EE” on page 54
- 4.3, “Installing IBM Spectrum Archive EE” on page 55
- 4.4, “Installing a RESTful server” on page 64
- 4.5, “Quick installation guide for IBM Spectrum Archive EE” on page 69
- 4.6, “Library replacement” on page 69
4.1 Installing IBM Spectrum Archive EE on a Linux system

The first part of this chapter describes how to install the IBM Spectrum Archive EE program on a Linux server system. In our lab setup for writing this book, we used a Red Hat-based Linux system. All the examples in this chapter are based on that release.

Although IBM Spectrum Archive EE is based on the IBM Linear Tape File System standard components as IBM Spectrum Archive and the IBM Spectrum Archive Library Edition (LE), these components are all included with the IBM Spectrum Archive EE installation package.

Before you can start with the installation routines, you must verify the following installation prerequisites:

- Installation prerequisites (see 4.2, “Installation prerequisites for IBM Spectrum Archive EE” on page 54)

  This section describes the tasks that must be completed before installing IBM Spectrum Archive EE.

- Installing IBM Spectrum Archive EE on a Linux server (see 4.3, “Installing IBM Spectrum Archive EE” on page 55)

  This section describes how to install the IBM Spectrum Archive EE package on a Linux server.

4.2 Installation prerequisites for IBM Spectrum Archive EE

This section describes the tasks that must be completed before installing IBM Spectrum Archive EE.

Ensure that the following prerequisites are met before IBM Spectrum Archive EE is installed. For more information, see the other topics in this section if needed.

- Verify that your computer meets the minimum hardware and software requirements for installing the product. For more information, see Chapter 3, “Planning” on page 39.

- Verify that your user ID meets the requirements for installing the product (such as you are working with the root user ID or have the root administration permissions).

- Ensure that you reviewed all of the planning information that is described in Chapter 3, “Planning” on page 39.

- If the standard IBM Spectrum Archive LE is already installed, it must be uninstalled before IBM Spectrum Archive EE is installed. For more information, see 10.4, “IBM Spectrum Archive EE interoperability with IBM Spectrum Archive products” on page 295.

- Ensure that all prerequisite software is installed, as described in 4.2.1, “Installing the host bus adapter and device driver” on page 55.

- Ensure that the host bus adapter (HBA) and device driver are installed, as described in 4.2.1, “Installing the host bus adapter and device driver” on page 55.
▶ Determine the distribution package for IBM Spectrum Archive EE that is required for your system.
▶ For IBM Spectrum Scale prerequisites, see 3.3, “Hardware and software setup” on page 44.

4.2.1 Installing the host bus adapter and device driver

This section describes how to install the HBA and its device driver for use with IBM Spectrum Archive EE.

To install the HBA and its device driver, see the documentation that is provided by the HBA manufacturer.

If the HBA attached to the tape library is an Emulex adapter, add the following line to the /etc/modprobe.d/lpfc.conf file:

```
options lpfc lpfc_sg_seg_cnt=256
```

Then, restart the server system for the change to take effect.

For more information about fixes and updates for your system’s software, hardware, and operating system, see IBM Support’s Fix Central web page.

4.3 Installing IBM Spectrum Archive EE

This section describes the process that is used to install IBM Spectrum Archive EE package. This installation package is provided by IBM to you on a DVD.

Consider the following points:

▶ Information that is contained in the readme file and installation file that are provided with the IBM Spectrum Archive EE distribution package supersedes information that is presented in this book and the online IBM Knowledge Center.

▶ The IBM Spectrum Archive EE license does not entitle customers to use any other IBM Tivoli® Storage Manager components or products. All components that are needed to migrate data to the LTFS file space are integrated into IBM Spectrum Archive EE. They also are part of the provided installation package and IBM Spectrum Archive EE license and are to be used only in this context.

▶ If IBM Spectrum Archive LE is already installed, it must be uninstalled before IBM Spectrum Archive EE is installed.

If IBM Spectrum Archive EE is installed (such as an older version), it must be uninstalled before the latest version of IBM Spectrum Archive EE is installed. To update the EE package, an installation script (ltfsee_install) is provided that does the automatic uninstallation during the software update. The next sections show you how to use this IBM Spectrum Archive EE installation script for different purposes and maintenance.

It also is possible to install, upgrade, or uninstall IBM Spectrum Archive EE manually. For more information, see 10.4, “IBM Spectrum Archive EE interoperability with IBM Spectrum Archive products” on page 295.
4.3.1 Extracting binary rpm files from an installation package

This first task lists the necessary steps to perform before binary rpm files are extracted. It also presents the available methods for extracting binary rpm files from an installation package for IBM Spectrum Archive EE on a Linux server system.

Interactive console mode is the method that is used for extracting binary rpm files from an installation package.

Before you use any of these methods to extract the IBM Spectrum Archive EE binary rpm files, you must confirm or set the run permission of the installation package.

**Important:** The `ltfsee-[version]-[buildlevel].bin` installation package includes rpm files for the revision and supported platforms.

Before the IBM Spectrum Archive EE binary rpm files are extracted from an installation package, complete the following steps:

1. Confirm the run permission of `ltfsee-[version]-[buildlevel].bin` by running the following command:
   ```shell
   # ls -l ltfsee-[version]-[buildlevel].bin
   ```
2. If it is not already set, set the run permission by running the following command:
   ```shell
   # chmod +x ltfsee-[version]-[buildlevel].bin
   ```
3. Proceed with the extraction of the binary IBM Spectrum Archive EE rpm files by selecting one of the procedures that are described next.

In the lab setup that was used for this book, we used the interactive console mode method, which is the option most users are likely to use.

**Extracting binary rpm files in interactive console mode**

This section describes how to extract binary rpm files from the IBM Spectrum Archive EE installation package by using the interactive console mode.

**Important:** The steps in this section extract binary rpm files to your local disk only. To complete the installation process, more steps are required. After you complete the extraction of the binary rpm files, see “Installing, upgrading, or uninstalling IBM Spectrum Archive EE automatically” on page 59 or 4.5, “Quick installation guide for IBM Spectrum Archive EE” on page 69 for more information.

To extract IBM Spectrum Archive EE binary rpm files in interactive console mode, complete the following steps:

1. Run IBM Spectrum Archive EE on the system by running the appropriate command for your environment:
   - If your operating system is running on the command-line interface (CLI), run the following command:
     ```shell
     #./ltfsee-[version]-[buildlevel].bin
     ```
   - If your operating system is running on the GUI (X Window System), run the following command:
     ```shell
     #./ltfsee-[version]-[buildlevel].bin -i console
     ```
The messages that are shown in Example 4-1 are displayed.

**Example 4-1  Extract binary rpm files in interactive console mode**

Preparing to install...
Extracting the installation resources from the installer archive...
Configuring the installer for this system's environment...

Launching installer...

**Important:** You cannot select the installation and link folders with the console installer. They are created in the `~/LTFSEE/` directory, which is the default folder of the installer that extracts the required files.

The installation script `ltfsee_install` for the command-line installation is found under the `~/LTFSEE/rpm.[version]_[buildlevel]` folder; for example, the `~/LTFSEE/rpm.1220_10326/` subfolder.

2. Read the International Program License Agreement. Enter 1 to accept the agreement and press **Enter** to continue, as shown in Example 4-2.

**Example 4-2  IBM Spectrum Archive EE International Program License Agreement**

===============================================================================
IBM Spectrum Archive Enterprise Edition (created with InstallAnywhere)
===============================================================================

Preparing CONSOLE Mode Installation...

===============================================================================

International License Agreement for Early Release of Programs

Part 1 - General Terms

BY DOWNLOADING, INSTALLING, COPYING, ACCESSING, CLICKING ON AN "ACCEPT" BUTTON, OR OTHERWISE USING THE PROGRAM, LICENSEE AGREES TO THE TERMS OF THIS AGREEMENT. IF YOU ARE ACCEPTING THESE TERMS ON BEHALF OF LICENSEE, YOU REPRESENT AND WARRANT THAT YOU HAVE FULL AUTHORITY TO BIND LICENSEE TO THESE TERMS. IF YOU DO NOT AGREE TO THESE TERMS,

* DO NOT DOWNLOAD, INSTALL, COPY, ACCESS, CLICK ON AN "ACCEPT" BUTTON, OR USE THE PROGRAM; AND

* PROMPTLY RETURN THE UNUSED MEDIA, DOCUMENTATION, AND PROOF OF ENTITLEMENT TO THE PARTY FROM WHOM IT WAS OBTAINED FOR A REFUND OF THE AMOUNT PAID. IF THE PROGRAM WAS DOWNLOADED, DESTROY ALL COPIES OF THE PROGRAM.

1. Definitions

Press Enter to continue viewing the license agreement, or enter "1" to accept the agreement, "2" to decline it, "3" to print it, or "99" to go back to the previous screen.
3. An **Installing...** message displays while the files are extracted to the `~/LTFSEE/` installation folder, as shown in Example 4-3. You can monitor the progress by watching the text-animated progress bars.

**Example 4-3  IBM Spectrum Archive EE installation of the binary files**

```
Installing...
```

When the files are successfully extracted, the text-based installer completes.

**Important:** The following symbolic links are created in your home directory:

- A link to the rpm folder that keeps the extracted rpm files.
- A link to the “Change IBM Linear Tape File System Enterprise Edition Installation” executable file that uninstalls IBM Spectrum Archive EE.

4. Go to the `rpm.[version]_[buildlevel]` folder under the installation folder to locate the `rpm` folder and access the installation file. If you created symbolic links, click the rpm symbolic link or use the Linux operating system `cd ~/rpm` command to open the `rpm` folder.

**Important:** Two files, `INSTALL_EE.[version]_[buildlevel]` and `README_EE.[version]_[buildlevel]`, are placed in the `rpm` folder. Folders that correspond to the supported platforms are created in the `rpm` folder as well. The specific rpm files for the supported platform are in the platform subdirectory.

When you successfully finish, continue to “Installing, upgrading, or uninstalling IBM Spectrum Archive EE automatically” on page 59 to complete the installation. If you prefer to install manually, see 4.5, “Quick installation guide for IBM Spectrum Archive EE” on page 69.

### 4.3.2 Installing, upgrading, or uninstalling IBM Spectrum Archive EE

This section describes how to install, upgrade, or uninstall binary rpm files for IBM Spectrum Archive EE after extracting them from the installation package, as described in 4.3.1, “Extracting binary rpm files from an installation package” on page 56.

IBM Spectrum Archive EE can be automatically installed, upgraded, or uninstalled.

IBM Spectrum Archive EE nodes communicate by using several TCP/UDP ports. Because some ports are assigned dynamically within a wide range, you must disable any firewall program that runs on these nodes.
During this installation for the IBM Spectrum Archive EE rpm files, there is also an MIB file that is provided if you plan to use SNMP for monitoring of your IBM Spectrum Archive EE setup. SNMP monitoring software usually requires such an MIB file to manage the various SNMP traps sent to it. The IBM Spectrum Archive EE MIB file is in the 
\~/opt/ibm/ltfsee/share/IBMSA-MIB.txt directory.

Installing, upgrading, or uninstalling IBM Spectrum Archive EE automatically

This section describes how to install, upgrade, or uninstall binary rpm files for IBM Spectrum Archive EE automatically after extracting them from the installation package. We used this method during our lab setup to write this book and document the examples.

The automated method is based on a utility (a shell script), which is provided by the IBM Spectrum Archive EE installation package. The script is named ltfsee_install and can be found after extracting the binary installation files in the 
\~/LTFSEE/rpm.[version]_[buildlevel] directory with the IBM Spectrum Archive EE rpm files (such as /root/LTFSEE/rpm.1220_10326/).

The following prerequisite conditions must be met before you proceed with this task:

- **Required software:**
  - For more information about installing the required software on a Linux system, see 4.2.1, “Installing the host bus adapter and device driver” on page 55.

- **IBM Spectrum Scale settings:**
  - The node must belong to an IBM Spectrum Scale cluster.
  - The GPFS daemons must be started.
  - For information about how to create an IBM Spectrum Scale cluster, see IBM Knowledge Center.

**ltfsee_install utility**

Use the ltfsee_install command-line utility to install rpm packages automatically to the system. You must have root user authority to use this command.

For more information, see “Installing, upgrading, or uninstalling IBM Spectrum Archive EE automatically” on page 59.

---

**Important:** On Red Hat Enterprise Linux 7, managing system services are done with the systemctl command.

To stop the firewall service, run the systemctl stop firewalld command.

To prevent the firewall service from being automatically started at start time, run the systemctl disable firewalld command.

In addition, you can mask the firewallel service to prevent it from being started manually or by another service by running the systemctl mask firewalld command.

These commands should be run on every power cycle of the server.
The `ltfsee_install <option>` command installs the following rpm packages to the system:

- IBM Spectrum Archive LE component
- Integrated customized Tivoli Storage Manager for Space Management with IBM Spectrum Archive EE
- IBM Spectrum Archive Migration Driver

The command includes the following options:

- **--install**
  Install rpm packages. If rpm packages are already installed, the installation is stopped.

- **--upgrade**
  Upgrade installed rpm packages.

- **--clean**
  Uninstall rpm packages.

- **--verify**
  Verify the prerequisite conditions and IBM Spectrum Archive Enterprise Edition package installation only. No installation will be performed.

- **--check**
  Check the prerequisite conditions only. No installation will be performed.

Verify that these conditions are met by logging on to the operating system as a root user and running the following command:

```
# ./ltfsee_install --check
```

If the conditions are met, the following message is shown as the last line of output:

The prerequisites checking is completed successfully.

Example 4-4 shows the complete output.

**Example 4-4  Output for the ltfsee_install --check command**

```
./ltfsee_install --check
Checking rpm installation and version.

The prerequisites checking is completed successfully.
```

The `ltfsee_install` file installs or upgrades all required rpm packages on the server node. It can also uninstall those rpm packages from the node if needed.

**Important:** The `ltfsee_install` command procedures in this topic automatically perform all operations from 4.5, “Quick installation guide for IBM Spectrum Archive EE” on page 69, except for installing optional TIVsm language packages in case they are needed.
Complete the following steps to automatically install, upgrade, or uninstall IBM Spectrum Archive EE by running the `ltfsee_install` command:

1. Log on to the operating system as a root user.
2. On each node in the cluster, complete the set of tasks for the action you want to take:
   a. Installing IBM Spectrum Archive EE on the node:
      i. Run the following command:
         ```
         # ./ltfsee_install --install
         ```
         Example 4-5 shows you the complete output of the `ltfsee_install --install` command.
      ii. Verify that the command completed successfully. Check for the following success message in the command output:
         ```
         All rpm packages are installed successfully.
         ```

**Example 4-5  Output for the ltfsee_install --install command**

```
# ./ltfsee_install --install
Checking rpm installation and version.

The prerequisites checking completed successfully.

(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
IBM Tivoli Storage Manager  
Command Line Space Management Client Interface  
Client Version 7, Release 1, Level 6.3  
Client date/time: 12/08/2016 19:47:49  
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

TSM The node failover option is now enabled in mode ENABLED.  
All rpm packages are installed successfully.  
Complete the configuration using /opt/ibm/ltfsee/bin/ltfsee_config  
command.

iii. Complete the configuration by running the /opt/ibm/ltfsee/bin/ltfsee_config  
command, as described in 5.2, “Configuring IBM Spectrum Archive EE” on  
page 85.

b. Upgrading the rpm files to the latest versions:

   Note: To avoid any unexpected failures during a multi node system upgrade, run  
ltfsee_install --upgrade on one node at a time and wait until the process  
completes before running the upgrade on the next node.

i. Run the eeadm cluster stop command.

ii. Run the pidof mmm command on all active control nodes and wait until there are no  
processes returned.

iii. Run the pidof ltfs command on every EE node and wait until there are no  
processes returned.

   To perform the upgrade process, run the command shown in Example 4-6.

   Example 4-6 Running the pidof ltfs command
   
   # ./ltfsee_install --upgrade
   [root@ltfsml1 rpm.1220_10326]# .ltfsee_install --upgrade

   Force installation option is selected.

   This option uninstalls the following preinstalled packages before  
installation:  
   - LE component  
   - HSM component  
   - LTFS Migration Driver

   These packages will be upgraded to the version that IBM Spectrum Archive  
Enterprise Edition provides.

   Do you want to continue? (y/n) y

iv. Verify that the command completed. Check for the following success message in  
the command output:

   All rpm packages are installed successfully.
c. Uninstalling IBM Spectrum Archive EE from the node:
   i. Run the following command:
      
      ```shell
      # ltfsee_install --clean
      ```
   ii. Verify that the command completed. Check for the following success message in
       the command output:
       
       Uninstallation is completed.

3. Verify that the installation or uninstallation completed successfully by running the following
   command:
   
   ```shell
   # ltfsee_install --verify
   ```
   If the installation was successful, the following message is shown:
   
   Module installation check is completed.

### 4.4 Installing a RESTful server

This section describes how to install the IBM Spectrum Archive EE REST API after extracting
the installation package, as described in 4.3.1, “Extracting binary rpm files from an installation
package” on page 56 and installing IBM Spectrum Archive EE as described in 4.3.2,
“Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58. This section
should be followed after IBM Spectrum Archive EE has been installed.

The rest service can be installed on any node within the cluster that has IBM Spectrum
Archive EE installed. To start the installation, some software requirements must be met before
the rpm can be installed.

The following are the required software applications:

- IBM Spectrum Archive v1.2.4 or later
- httpd
- mod_ssl
- mod_wsgi
- Python 2.4 or later, but earlier than 3.0
- Flask

Example 4-7 shows how to perform the installation of the required software to run REST.

**Example 4-7  Required software for rest installation**

```
[root@ltfseesrv1 ~]# yum install -y httpd mod_ssl mod_wsgi
Loaded plugins: langpacks, product-id, rhnplugin, search-disabled-repos, subscription-manager
This system is receiving updates from RHN Classic or Red Hat Satellite.

Complete!

If pip is not installed on the designated node (pip is installed by default if the version of Python is 2.7.9 or greater), it can be installed by running the following commands:

curl "https://bootstrap.pypa.io/get-pip.py" -o "get-pip.py"
python get-pip.py

After pip is installed, run the following command to install flask version 0.12.2:
pip install flask==0.12.2

Example 4-8 shows how to install flask.

Example 4-8   Install flask V0.12
[root@ltfseesrv1 ~]# pip install flask==0.12.2

After all the required software has been installed, in the same directory that the IBM Spectrum Archive EE was extracted to, there is an RHEL7 directory that contains a file called .ibmsa-rest-[version]-[buildlevel].x86_64.rpm. To install the restful service, run the `yum install` command on this file, as shown in Example 4-9.

Example 4-9  Installing IBM Spectrum Archive Rest service

[root@ltfseesrv1 RHEL7]# yum install -y ibmsa-rest-1.2.4.0-12441.x86_64.rpm
Loaded plugins: langpacks, product-id, rhnplugin, subscription-manager
This system is receiving updates from RHN Classic or Red Hat Satellite.
Examining ibmsa-rest-1.2.4.0-12441.x86_64.rpm: ibmsa-rest-1.2.4.0-12441.x86_64
Marking ibmsa-rest-1.2.4.0-12441.x86_64.rpm to be installed
Resolving Dependencies
  --> Running transaction check
  --> Package ibmsa-rest.x86_64 0:1.2.4.0-12441 will be installed
  --> Finished Dependency Resolution

  ibmsa-rest  x86_64  1.2.4.0-12441
  /ibmsa-rest-1.2.4.0-12441.x86_64 51 k

Total size: 51 k
Installed size: 51 k
At the bottom of a successful installation, it says the installation was successful and that a restart of the httpd service is required to enable the rest server. To restart the service, run the following command:

```
systemctl restart httpd
```

**Note:** If REST is already installed on cluster updating IBM Spectrum Archive EE will automatically update the REST interface, however a manual restart of httpd is required after starting IBM Spectrum Archive EE.

When this is all done, to quickly test that the rest service has been successfully installed, run the following command:

```
curl -i -X GET 'http://localhost:7100/ibmsa/v1'
```

Example 4-10 shows using a **test curl** command to see whether the installation was successful.

**Example 4-10  Test curl command**

```
[root@ltfseesrv1 ~]# curl -i -X GET 'http://localhost:7100/ibmsa/v1'
HTTP/1.1 200 OK
Date: Wed, 12 Jul 2017 22:03:00 GMT
Server: Apache/2.4.6 (Red Hat Enterprise Linux) OpenSSL/1.0.1e-fips mod_wsgi/3.4 Python/2.7.5
Content-Length: 83
Content-Type: application/json

{"message":"IBM Spectrum Archive REST API server is working.","status_code":"200"}
```

The default port is on 7100 and the default protocol to use is http. If SSL is required, uncomment **SSLEngine**, **SSLCertificateFile**, **SSLCertificateKeyFile** and provide the direct path to both the certificate file and the certificate key file in the following file:

```
/etc/httpd/conf.d/ibmsa-rest-httpd.conf
```

For an overview of IBM Spectrum Archive EE Rest API and commands, see 6.26, “IBM Spectrum Archive REST API” on page 194.
4.5 Quick installation guide for IBM Spectrum Archive EE

This section summarizes the overall installation process of IBM Spectrum Archive EE:

1. Ensure that all prerequisite software (Linux packages) and HBA driver are installed.

2. Ensure that the IBM Spectrum Scale file system daemon is started by running the following command:

   ```
   mmstartup -a
   ```

3. Extract the binary rpm files from an IBM Spectrum Archive EE installation package by running the following command:

   ```
   ./ltfsee-1.3.0.0_13064.bin
   ```

4. Install IBM Spectrum Archive EE automatically by using the `ltfsee_install` tool. Use `--check` for pre-installation check, `--install` for the installation, and `--verify` for a postinstallation verification, as shown in the following commands:

   ```
   ~/LTSEE/rpm.[version]_[buildlevel]/ltfsee_install --check
   ~/LTSEE/rpm.[version]_[buildlevel]/ltfsee_install --install
   ~/LTSEE/rpm.[version]_[buildlevel]/ltfsee_install --verify
   ```

4.6 Library replacement

Library replacement has been introduced to give users the ability to upgrade their older tape library to a newer tape library. There are two library replacement scenarios available for users to perform: a complete library replacement, and a pool relocation. Both are disruptive, but the pool relocation offers less down time and the ability to continue running IBM Spectrum Archive while the pool that is going to be relocated is disabled.

The library replacement procedure requires the user to halt their environment to perform, due to the relocation of all tape cartridges and possibly all tape drives to a newer library.

The pool relocation procedure requires a multi-library configuration so that a pool can be relocated from one library to the other. While the pool is being relocated operations are not allowed on that pool however the other pools are still available for operations.

In addition to these new procedures, IBM Spectrum Archive EE now appends a new state for tape cartridges, appendable. This new state is determined by the pool settings and the state of the tape to determine if the tape is candidate for migration. An appendable tape cartridge within a pool allows data to be written to that tape. Those tapes can either be empty, or partially filled with data.

Non-appendable tape cartridges are tapes that do not allow writes to the tape.

Non-appendable tape cartridges result from being completely full, erroneous tapes, or tapes within pools that do not match their media-restriction or format type. With the introduction of this new tape state, users have better control over the flow of their data from disk to tape and from tape to tape. Refer to 6.11.5, “Data Migration” on page 158.

**Note:** The following library replacement procedures are supported with IBM Spectrum Archive EE v1.2.6 and above.
4.6.1 Library replacement procedure

This procedure should be used if you are switching or upgrading your current tape library to another tape library and want to continue using the tapes and tape drives and cluster configuration within your IBM Spectrum Archive EE environment. For example, you might be replacing your existing TS3500 tape library with a new TS4500 tape library. To do so, complete these steps:

1. Identify the library name and serial number that you intend to replace, for use in the subsequent steps. Example 4-11 shows how to get a list of libraries and serial numbers by running the `ltfsee_config -m LIST_LIBRARIES` command.

   **Example 4-11  ltfsee_config -m LIST_LIBRARIES**

   ```
   [root@server1 ~]# ltfsee_config -m LIST_LIBRARIES
   The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m LIST_LIBRARIES
   LIST_LIBRARIES mode starts .

   ## 1. Check to see if the cluster is already created ##
   The cluster is already created and the configuration file ltfsee_config.filesystem exists.

   Library Name     Serial Number       Control Node
   lib1             0000013FA0520401    9.11.244.22
   lib2             0000013FA052041F    9.11.244.23
   ```

2. If the tape drives from the old library will not be used in the new library, remove the tape drives by using the `eeadm drive unassign` command. Refer to “IBM Spectrum Scale commands” on page 288 for more information about the command.

3. Stop IBM Spectrum Archive EE by executing the `eeadm cluster stop` command.

4. Replace the physical old tape library with the new tape library.

5. Physically move all of the tape cartridges to the new library.

6. If you are moving the tape drives from the old tape library to the new library, physically remove the tape drives from the old tape library and install them in the new library. The drives need to be attached to the same node that they were attached to before.

7. The `REPLACE_LIBRARY` command associates the new library’s serial number with the old library’s ID. Example 4-12 shows the output from running the `ltfsee_config -m REPLACE_LIBRARY` command to associate the new library with the old library serial number.

   **Example 4-12  ltfsee_config -m REPLACE_LIBRARY**

   ```
   [root@server1 ~]# ltfsee_config -m REPLACE_LIBRARY
   The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m REPLACE_LIBRARY
   REPLACE_LIBRARY mode starts .

   ## 1. Check to see if the cluster is already created ##
   The cluster is already created and the configuration file ltfsee_config.filesystem exists.
   ** Configuration change for library: lib1

   The number of logical libraries with the assigned control node: 2
   The number of logical libraries available from this node: 1
   ```
The number of logical libraries available from this node and with assigned control node: 0

** Select the tape library from the following list and input the corresponding number. Then press Enter.

<table>
<thead>
<tr>
<th>Model</th>
<th>Serial Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 03584L32</td>
<td>0000013FA052041B</td>
</tr>
</tbody>
</table>

q. Exit from this Menu

Input Number > 1 is going to be set to library lib1. Do you want to continue (y/n)? Input > y

Restarting HSM daemon on server1

The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m RESTART_HSM

RESTART_HSM mode starts.

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.
Deactivating failover operations on the node.
Restarting Space Management service...
Stopping the HSM service.
Terminating dsmwatchd............
Starting the HSM service.
Starting dsmmigfs..........................
Activating failover operations on the node.

Restarting HSM daemon on server2

The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m RESTART_HSM

RESTART_HSM mode starts.

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.
Deactivating failover operations on the node.
Restarting Space Management service...
Stopping the HSM service.
Terminating dsmwatchd............
Starting the HSM service.
Starting dsmmigfs..........................
Activating failover operations on the node.

REPLACE_LIBRARY mode completed.
8. Verify library serial change by running the `ltfsee_config -m LIST_LIBRARIES`.

9. Start IBM Spectrum Archive EE by using the `eeadm cluster start` command.

10. If you are using new drives in the new library, configure the drives with the `eeadm drive assign` command. See “The eeadm <resource type> --help command” on page 282 for more information about the command.

### 4.6.2 Pool relocation procedure

Use this procedure to logically and physically move a tape pool from one library (the source) to another library (the destination), within an IBM Spectrum Archive EE cluster. During the procedure, the tape pool that is being moved is disabled. However, during most of the procedure, the IBM Spectrum Archive EE system remains online, and other tape pools remain available for operations.

**Note:** Pool relocation will fail if any files are migrated to pools from IBM Spectrum Archive EE v1.1. To determine if any pools have files from v1.1, run the following command:

```bash
ltfsee_count_v11_files -p <pool_name> -l <library_name>
```

Pool relocation only works in a multi-library IBM Spectrum Archive EE cluster. Therefore, if you have a single-library environment and want to move a pool, you first need to have a second IBM Spectrum Archive EE node added to the cluster and an identical media type secondary tape library attached.

For the pool replacement procedure the following assumptions are made:

- IBM Spectrum Archive EE is configured as multi-library configuration.
- A pool is selected to move from one library (called the *source library*) to another library (called the *destination library*).
- All physical tape cartridges in the selected pool are moved to the destination library manually.

1. Get the pool information that is being relocated by running the `eeadm pool list` command.

2. Stop IBM Spectrum Archive EE.

3. Prepare the selected pool for relocation with the `ltfsee_config -m PREPARE_MOVE_POOL` command. Example 4-13 shows the output from running the command on pool1 from library lib1 to library lib2.

```
Example 4-13  ltfsee_config -m PREPARE_MOVE_POOL

[root@server1 ~]# ltfsee_config -m PREPARE_MOVE_POOL -p pool1 -s lib1 -d lib2
```

**Note:** In releases before IBM Spectrum Archive EE version 1.2.6, the serial number of a library was used as the library ID. Beginning with version 1.2.6, the library ID can have a unique value other than the serial number. A UUID is assigned as the library ID in libraries that are configured with version 1.2.6 and subsequent releases.

With the separation of the library ID from the library serial number, IBM Spectrum Archive EE can replace a library by changing the library serial number that is associated with the library ID. The configuration of the cartridges, and pools, and drives in the old library is transferred to the new library.
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m PREPARE_MOVE_POOL -p pool1 -s lib1 -d lib2
PREPARE_MOVE_POOL mode starts.

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.

Start the mmapplypolicy GPFS command to get a list of migrated files that are in IBM Spectrum Archive V1.1 format.

Starting IBM Spectrum Archive EE to refresh the index cache of the libraries.

Library name: lib2, library serial: 0000013FA052041F, control node (ltfsee_md)
IP address: 9.11.244.23.
Running start command - sending request : lib2.
Library name: lib1, library serial: 0000013FA052041B, control node (ltfsee_md)
IP address: 9.11.244.22.
Running start command - sending request : lib1.
Running start command - waiting for completion : lib2.

..................
Started the IBM Spectrum Archive EE services for library lib2 with good status.
Running start command - waiting for completion : lib1.

Started the IBM Spectrum Archive EE services for library lib1 with good status.

Stopping IBM Spectrum Archive EE.

Library name: lib2, library serial: 0000013FA052041F, control node (ltfsee_md)
IP address: 9.11.244.23.
Running stop command - sending request and waiting for the completion.
Library name: lib1, library serial: 0000013FA052041B, control node (ltfsee_md)
IP address: 9.11.244.22.
Running stop command - sending request and waiting for the completion...
Stopped the IBM Spectrum Archive EE services for library lib2.
Stopped the IBM Spectrum Archive EE services for library lib1.

Checking tapes with a duplicated VOLSER in library lib1 and lib2.

Copying pool definitions from library lib1 to lib2.

Saving index cache of the tapes in pool pool1.

PREPARE_MOVE_POOL mode completed.

**Note:** Pools with the same name appear in the source and destination libraries after this command. (The pool name specified for relocation must not exist in the destination library before this command). The mode attribute of the source pool is set to relocation_source, and the mode attribute of the destination pool is set to relocation_destination.
4. List pools that have been or are in process of being moved, as shown in Example 4-14.

Example 4-14  List relocated pools

[root@server1 ~]# ltfsee_config -m LIST_MOVE_POOLS
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m
LIST_MOVE_POOLS
LIST_MOVE_POOLS mode starts .

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file
ltfsee_config.filesystem exists.

<table>
<thead>
<tr>
<th>Source pool</th>
<th>Destination pool</th>
<th>Activated</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool1@lib1</td>
<td>pool1@lib2</td>
<td>no</td>
</tr>
</tbody>
</table>

5. Start IBM Spectrum Archive EE by using the eeadm cluster start command.

Note: Jobs related to the tapes in the pool with "source" or "destination" in the Mode
attribute will be rejected.

6. Make a list of tapes which belong to the pool for relocation with the eeadm tape list
command.

7. Move tapes within the selected pool to the IE slot to remove from the previous library using
the eeadm tape move <tape1[tape2 tape3 ...] -L ieslot -p <pool> -l <library>
command.

8. Stop IBM Spectrum Archive.

9. Activate the pool for relocation by running the ltfsee_config -m ACTIVATE_MOVE_POOL
command. Example 4-15 illustrates activating the relocated pool after all tapes have been
physically moved to the new tape library.

Example 4-15  The ltfsee_config -m ACTIVATE_MOVE_POOL command

[root@server1 ~]# ltfsee_config -m ACTIVATE_MOVE_POOL -p pool1 -s lib1 -d lib2
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m
ACTIVATE_MOVE_POOL -p pool1 -s lib1 -d lib2
ACTIVATE_MOVE_POOL mode starts .

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file
ltfsee_config.filesystem exists.

Starting IBM Spectrum Archive EE to refresh the index cache of the libraries.

Library name: lib2, library serial: 0000013FA052041F, control node (ltfsee_md)
IP address: 9.11.244.23.
Running start command - sending request : lib2.
Library name: lib1, library serial: 0000013FA052041B, control node (ltfsee_md)

Configuration

This chapter provides information about the postinstallation configuration of the IBM Spectrum Archive Enterprise Edition (IBM Spectrum Archive EE).

This chapter includes the following topics:
- 5.1, “Configuration prerequisites” on page 78
- 5.2, “Configuring IBM Spectrum Archive EE” on page 85
- 5.3, “First-time start of IBM Spectrum Archive EE” on page 98

Note: In the lab setup for this book, we used a Red Hat-based Linux system. The screen captures within this chapter are based on Version 1 Release 3 of the product. Although the steps that you will perform are the same, you might see slightly different output responses depending on your currently used version and release of the product.
5.1 Configuration prerequisites

This section describes the tasks that must be completed before IBM Spectrum Archive EE is configured.

Ensure that the following prerequisites are met before IBM Spectrum Archive EE is configured. For more information, see 5.2, “Configuring IBM Spectrum Archive EE” on page 85.

- The Configuration worksheet is completed and available during the configuration process.

| Tip: Table 5-1 on page 78, Table 5-2 on page 79, Table 5-3 on page 79, Table 5-4 on page 80, Table 5-5 on page 80, and Table 5-6 on page 81 provide a set of sample configuration worksheets. You can print and use these samples for your own purpose during your configuration of IBM Spectrum Archive EE.

- The key-based login with OpenSSH is configured.
- The IBM Spectrum Scale system is prepared and ready for use on your Linux server system.
- The control paths (CPs) to the tape library logical libraries are configured and enabled. You need at least one CP per node.

5.1.1 Configuration worksheet tables

Print Table 5-1 on page 78, Table 5-2 on page 79, Table 5-3 on page 79, Table 5-4 on page 80, Table 5-5 on page 80, and Table 5-6 on page 81 and use them as worksheets or as a template to create your own worksheets to record the information you need to configure IBM Spectrum Archive EE.

For more information, see 5.1.2, “Obtaining configuration information” on page 81 and follow the steps to obtain the information that is required to complete your worksheet.

The information in the following tables is required to configure IBM Spectrum Archive EE. Complete Table 5-4 on page 80, Table 5-5 on page 80, and Table 5-6 on page 81 with the required information and refer to this information as necessary during the configuration process, as described in 5.2, “Configuring IBM Spectrum Archive EE” on page 85.

Table 5-1, Table 5-2, and Table 5-3 show example configuration worksheets with the parameters completed for the lab setup that was used to write this book.

Table 5-1 lists the file systems.

<table>
<thead>

Figure 5-1 shows an example of a TS3500 GUI window that you use to display the starting SCSI element address of a TS3500 logical library. You must record the decimal value (starting address) to calculate the associated logical library serial number by using as shown in Table 5-2 on page 79. You can open this window if you check for the details for a specific logical library.

### 5.1.2 Obtaining configuration information

To obtain the information about your environment that is required for configuring IBM Spectrum Archive EE, complete the following steps:

1. Log on to the operating system as a root user.
2. Start GPFS (if it is not started already) by running the following command (see Example 5-1 on page 82):
   ```bash
   # mmstartup -a
   ```
3. Mount GPFS (if it is not already mounted) by running the following command (see Example 5-1 on page 82):
   ```bash
   # mmmount all
   ```
4. Obtain a list of all GPFS file systems that exist in the IBM Spectrum Scale cluster by running the following command (see Example 5-1 on page 82):
   ```bash
   # mmlsfs all
   ```
5. Go to the Configuration worksheet (provided in 5.1.3, “Configuring key-based login with OpenSSH” on page 83) and enter the list of file system names in the GPFS file systems table.
6. Plan the GPFS file system that was used to store IBM Spectrum Archive EE internal data. For more information, see 5.1.4, “Preparing the IBM Spectrum Scale file system for IBM Spectrum Archive EE” on page 84.
7. Go to the Configuration worksheet and enter the GPFS file system that is used to store IBM Spectrum Archive EE internal data into Table 5-1 on page 78.
8. Obtain a list of all IBM Spectrum Scale nodes in the IBM Spectrum Scale cluster by running the following command (see Example 5-1 on page 82):
   ```bash
   # mmlsnode
   ```
9. Go to the Configuration worksheet and enter the list of IBM Spectrum Scale nodes and whether the IBM Spectrum Archive EE is installed on the node in Logical Tape Library table.
10. Obtain the logical library serial number, as described in the footnote of Table 5-2 on page 79. For more information and support, see the IBM Knowledge Center for your specific tape library.
11. Go to the Configuration worksheet and enter the logical library serial number that was obtained in the previous step into the IBM Spectrum Scale nodes table.

12. Obtain a list of all tape drives in the logical library that you plan to use for the configuration of IBM Spectrum Archive EE. For more information, see the IBM Knowledge Center for your specific tape library.

13. Go to the Configuration worksheet and enter the tape drive serial numbers that were obtained through the previous step into the IBM Spectrum Scale nodes table.

14. Assign each drive to one of the IBM Spectrum Archive EE nodes that are listed in the Logical Library Table in the Configuration worksheet and add that information to the IBM Spectrum Scale nodes table.

15. Assign at least one CP to each of the IBM Spectrum Archive EE nodes and enter whether each drive is a CP drive in the IBM Spectrum Scale nodes section of the Configuration worksheet.

16. Go to the Configuration worksheet and update the Logical Tape Library table with the tape drive assignment and CP drive information by adding the drive serial numbers in the appropriate columns.

Keep the completed configuration worksheet available for reference during the configuration process. Example 5-1 shows how to obtain the information for the worksheet.

**Example 5-1 Obtain the IBM Spectrum Scale required information for the configuration worksheet**

```bash
[root@ltfs97 ~]# mmstartup -a
Fri Apr  5 14:02:32 JST 2013: mmstartup: Starting GPFS ...
hthoru9.ltd.sdl:  The GPFS subsystem is already active.

[root@ltfs97 ~]# mmmount all
Fri Apr  5 14:02:50 JST 2013: mmmount: Mounting file systems ...

[root@ltfs97 ~]# mmlsfs all

File system attributes for /dev/gpfs:
=====================================

-j              cluster                  Block allocation type
-D              nfs4                     File locking semantics in effect
-k              all                      ACL semantics in effect
-n              32                       Estimated number of nodes that will mount file system
-B              4194304                  Block size
-Q              none                     Quotas accounting enabled
          none                     Quotas enforced
          none                     Default quotas enabled
--perfileset-quota no                       Per-fileset quota enforcement
--filesetdf no Fileset df enabled?
-V              20.01 (5.0.2.0)          File system version
--create-time Thu Sep 20 14:19:23 2018 File system creation time
-z              yes                      Is DMAPI enabled?
-L              33554432                  Logfile size
```
5.1.3 Configuring key-based login with OpenSSH

IBM Spectrum Archive EE uses the Secure Shell (SSH) protocol for secure file transfer and requires key-based login with OpenSSH for the root user.

To use key-based login with OpenSSH, it is necessary to generate SSH key files and append the public key file from each node (including the local node) to the `authorized_keys` file in the `~root/.ssh` directory.

The following points must be considered:

- This procedure must be performed on all IBM Spectrum Archive EE nodes.
- After completing this task, a root user on any node in an IBM Spectrum Archive EE cluster can run any commands on any node remotely without providing the password for the root on the remote node. It is preferable that the cluster is built on a closed network. If the cluster is within a firewall, all ports can be opened. For more information, see 4.3.1, “Extracting binary rpm files from an installation package” on page 56 and 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

To configure key-based login with OpenSSH, complete the following steps:

1. If the `~root/.ssh` directory does not exist, create it by running the following command:
   ```
   mkdir ~root/.ssh
   ```
2. If the root user does not have SSH keys, generate them by running the `ssh-keygen` command and entering CR at all prompts.

Important: You can verify whether the root user has a public key by locating the `id_rsa` and `id_rsa.pub` files under the `/root/.ssh/` directory. If these files do not exist, you must generate them.
3. After the key is generated, copy the key to each server that requires a key-based login for OpenSSH by running the following command:

```
ssh-copy-id root@<server>
```

4. Repeat these steps on each IBM Spectrum Archive EE node.

### 5.1.4 Preparing the IBM Spectrum Scale file system for IBM Spectrum Archive EE

Complete this task to create and mount the IBM Spectrum Scale file system before IBM Spectrum Archive EE is configured.

Before you make any system upgrades or major configuration changes to your GPFS or IBM Spectrum Scale cluster, review your GPFS or IBM Spectrum Scale documentation and consult IBM Spectrum Scale frequently asked question (FAQ) information that applies to your version of IBM Spectrum Scale. For more information about the IBM Spectrum Scale FAQ, see IBM Knowledge Center.

Before you begin this procedure, ensure that the following prerequisites are met:

- IBM Spectrum Scale is installed on each of the IBM Spectrum Archive EE nodes.
- The IBM Spectrum Scale cluster is created and all of the IBM Spectrum Archive EE nodes belong to the cluster.

IBM Spectrum Archive EE requires space for the file metadata, which is stored in the LTFS metadata directory. The metadata directory can be stored in its own GPFS file system, or it can share the GPFS file system that is being space-managed with IBM Spectrum Archive EE.

The file system that is used for the LTFS metadata directory must be created and mounted before the IBM Spectrum Archive EE configuration is performed. The following requirements apply to the GPFS file system that is used for the LTFS metadata directory:

- The file system must be mounted and accessible from all of the IBM Spectrum Archive EE nodes in the cluster.
- The GPFS file system (or systems) that are space-managed with IBM Spectrum Archive EE must be DMAPI enabled.

To create and mount the GPFS file system, complete the following steps:

1. Create a network shared disk (NSD), if necessary, by running the following command. It is possible to share an existing NSD with another GPFS file system.

```
# mmcrnsd -F nsd.list -v no
<<nsd.list>>
%nsd: device=/dev/dm-3
  nsd=nsd00
  servers=ltfs01, ltfs02, ltfs03, ltfs04
  usage=dataAndMetadata
```

2. Start the GPFS service (if it is not started already) by running the following command:

```
# mmstartup -a
```

3. Create the GPFS file system by running the following command. For more information about the file system name and mount point, see 5.1.1, “Configuration worksheet tables” on page 78.

```
# mmcrfs /dev/gpfs nsd00 -z yes -T /ibm/glues
```
Chapter 5. Configuration

In this example, /dev/gpfs is the file system name and /ibm/glues is the mount point. For a separate file system that is used only for the LTFS metadata directory, you do not need to use the -z option. Generally, if a GPFS file system is not intended to be IBM Spectrum Archive EE managed, it should not be DMAPI-enabled; therefore, the -z option should not be specified. The preferred configuration is to have one file system with DMAPI-enabled.

For more information about the inode size, see 7.5, “Preferred inode size for IBM Spectrum Scale file systems” on page 213.

4. Mount the GPFS file system by running the following command:

   # mmmount gpfs -a

   For more information about the mmmount command, see the following resources:
   - General Parallel File System Version 4 Release 1.0.4 Advanced Administration Guide, SC23-7032
   - IBM Spectrum Scale: Administration Guide, which is available at IBM Knowledge Center.

5.2 Configuring IBM Spectrum Archive EE

The topics in this section describe how to use the ltfsee_config command to configure IBM Spectrum Archive EE in a single node or multiple node environment. Instructions for removing a node from an IBM Spectrum Archive EE configuration are also provided.

5.2.1 The ltfsee_config utility

Use the ltfsee_config command-line utility to configure the IBM Spectrum Archive EE for single node or multiple node environment. You must have root user authority to use this command. This command also can be used to check an existing IBM Spectrum Archive EE configuration. The utility operates in interactive mode and guides you step-by-step through the required information that you must provide.

Reminder: All of the command examples use the command without the full file path name because we added the IBM Spectrum Archive EE directory (/opt/ibm/ltfsee/bin) to the PATH variable.

The ltfsee_config command-line tool is shown in the following example and includes the following options:

ltfsee_config -m <mode> [options]

-m

-<mode> and [options] can be one of the following items:

- CLUSTER [-c]

  Creates an IBM Spectrum Archive EE cluster environment and configures a user-selected IBM Spectrum Scale (GPFS) file system to be managed by the IBM Spectrum Archive or used for its metadata. The user must run this command one time from one of the IBM Spectrum Archive nodes. Running the command a second time modifies the file systems settings of the existing cluster.
- **ADD_CTRL_NODE** [-g | -c]
  Adds the local node as the control (MMM) node to a tape library in an existing IBM Spectrum Archive EE environment, and configures its drives and node group. There can be one or two control nodes per tape library.

**Note:** Even if you configure two control nodes per tape library, you still only run **ADD_CTRL_NODE** once per tape library.

- **ADD_NODE** [-g | -c]
  Adds the local node (as a non-control node) to a tape library, and configure its drives and node group. You choose whether or not the node is a control node as redundancy.

- **SET_CTRL_NODE**
  Configure or reconfigure one or two control nodes and select one node to be active at the next start of IBM Spectrum Archive EE.

- **UPDATE_FS_INFO**
  Apply the current information of IBM Spectrum Scale (GPFS) file system to IBM Spectrum Archive EE configuration.

- **REMOVE_NODE** [-N <node_id>] [-f]
  Removes the node and the drives configured for that node from the existing configuration.

- **REMOVE_NODEGROUP** -l <library> -G <removed_nodegroup>
  Removes the nodgroup that is no longer used.

- **INFO**
  Shows the current configuration of this cluster.

- **LIST_LIBRARIES**
  Shows the serial numbers of the tape libraries that are configured in the cluster.

- **REPLACE_LIBRARY** [-b]
  Sets the serial number detected by the node to that of the configured library.

- **LIST_MOVE_POOLS**
  Shows the pool translation table.

- **PREPARE_MOVE_POOL** -p <pool_name> -s <source_library> -d <destination_library> [-G <node_group>] [-b]
  Prepares the pool translation table information for pool relocations between libraries.

- **CANCEL_MOVE_POOL** -p <pool_name> -s <source_library> [-b]
  Cancels the **PREPARE_MOVE_POOL** operation for pool translation.

- **ACTIVATE_MOVE_POOL** -p <pool_name> -s <source_library> -d <destination_library> [-b]
  Activates the pool that was relocated to a different library.

- **RECREATE_STATESAVE**
  Delete and initialize the whole of statesave. By using this command, all history and running task information are removed.
Options:

- `-c`
  Check and show the existing cluster or node configuration, without configuring or modifying it.

- `-g`
  Assign the node to a node group that is selected or specified by user. If `-g` is not used, the node is added to the default node group, which is named G0 if it did not exist before.

- `-G`
  Specifies the nodegroup to assign to the pool in the destination library during translation between libraries, or the nodegroup to be removed.

- `-N`
  Remove a non-local node by specifying its node ID. If `-N` is not used, the local node is removed.

- `-f`
  Force node removal. If `-f` is not used, an attempt to remove a control node fails and the configuration remains unchanged. When a control node is removed by using `-f`, other nodes from the same library and the drives that are configured for those nodes are also removed. To avoid removing multiple nodes, consider first setting another configured non-control node from the same library as the control node (`SET_CTRL_NODE`).

- `-b`
 Skips restarting the HSM daemon as a post process of the operation.

- `-p`
  Specifies the name of the pool to be relocated to a different library.

- `-sa`
  Specifies the name of the source library for a pool relocation procedure.

- `-d`
  Specifies the destination library for a pool relocation procedure.

- `-l`
  Specifies the library name in which to remove a nodegroup with the `-N` option.
5.2.2 Configuring a single node cluster

Before you begin this procedure, ensure that all of the tasks that are described in 5.1, “Configuration prerequisites” on page 78 are met. Figure 5-2 shows a single-node configuration that is described in this section.

The steps in this section must be performed only on one node of an IBM Spectrum Archive EE cluster environment. If you plan to have only one IBM Spectrum Archive EE node, this is a so-called single-node cluster setup.

If you plan to set up a multi-node cluster environment for IBM Spectrum Archive EE, this configuration mode must be performed once, and only on a node of your choice of your cluster environment. All other nodes must be added. To do so, see 5.2.3, “Configuring a multiple-node cluster” on page 92.

To configure a single-node cluster for IBM Spectrum Archive EE, complete the following steps:

1. Log on to the operating system as a root user.
2. Start GPFS (if it is not already started) by running the following command:
   
   ```
   # mmstartup -a
   ```
3. Mount the GPFS file system (if it is not already mounted) by running the following command:
   
   ```
   # mmmount all
   ```
4. Start the IBM Spectrum Archive EE configuration utility with the -m CLUSTER option by running the following command and answering the prompted questions:
   
   ```
   # ltfsee_config -m CLUSTER
   ```
Example 5-2 shows the successful run of the `ltfsee_config -m CLUSTER` command during the initial IBM Spectrum Archive EE configuration on the lab setup that was used for this book.

**Example 5-2  Run the ltfsee_config -m CLUSTER command**

```
[root@ltfsml1 ~]# /opt/ibm/ltfsee/bin/ltfsee_config -m CLUSTER
CLUSTER mode starts.

## 1. Check whether the cluster is already created ##
Cluster is not configured, configuring the cluster.

## 2. Check prerequisite on cluster ##
Cluster name: ltfsml2-ltfsml1.tuc.stglabs.ibm.com
ID: 12003238441805965800
Successfully validated the prerequisites.

## 3. List file systems in the cluster ##
Retrieving IBM Spectrum Scale (GPFS) file systems...
** Select a file system for storing IBM Spectrum Archive Enterprise Edition configuration and internal data.
   Input the corresponding number and press Enter
   or press q followed by Enter to quit.
   
   File system
   1. /dev/gpfs  Mount point(/ibm/gpfs)  DMAPI(Yes)
   q. Quit

Input number > 1

** Select file systems to configure for IBM Spectrum Scale (GPFS) file system for Space Management.
   Input the corresponding numbers and press Enter
   or press q followed by Enter to quit.
   Press a followed by Enter to select all file systems.
   Multiple file systems can be specified using comma or white space delimiters.
   
   File system
   1. /dev/gpfs  Mount point(/ibm/gpfs)
   a. Select all file systems
   q. Quit

Input number > 1

## 4. Configure Space Management ##
Disabling unnecessary daemons...
Editing Space Management Client settings...
Restarting Space Management service...
Terminating dsmwatchd..............
Terminating dsmwatchd..............
Starting dsmmigfs............................
Configured space management.

## 5. Add selected file systems to the Space Management ##
Added the selected file systems to the space management.
```
## 6. Store the file systems configuration and dispatch it to all nodes ##
Storing the file systems configuration...
Copying ltfsee_config.filesystem file...
Stored the cluster configuration and dispatched the configuration file.

## 7. Create metadata directories and configuration parameters file ##
Created metadata directories and configuration parameters file.

CLUSTER mode completed.

**Important:** During the first run of the `ltfsee_config -m CLUSTER` command, if you see the following error:

No file system is DAPI enabled.
At least one file system has to be DAPI enabled to use IBM Spectrum Archive Enterprise Edition.
Enable DAPI of more than one IBM Spectrum Scale (GPFS) file systems and try again.

Ensure that DAPI is turned on correctly, as described in 5.1.4, “Preparing the IBM Spectrum Scale file system for IBM Spectrum Archive EE” on page 84. You can use the following command sequence to enable DAPI support for your GPFS file system (here the GPFS file system name that is used is gpfs):

```bash
# mmunmount gpfs
mmunmount: Unmounting file systems ...
# mmchfs gpfs -z yes
# mmunmount gpfs
mmunmount: Mounting file systems ...
```

5. Run the IBM Spectrum Archive EE configuration utility by running the following command and answering the prompted questions:

```bash
# ltfsee_config -m ADD_CTRL_NODE
```

Example 5-3 shows the successful run of the `ltfsee_config -m ADD_CTRL_NODE` command during initial IBM Spectrum Archive EE configuration on the lab setup that was used for this book.

**Example 5-3 Run the ltfsee_config -m ADD_CTRL_NODE command**

```
[root@ltfsml1 ~]# /opt/ibm/ltfsee/bin/ltfsee_config -m ADD_CTRL_NODE
ADD_CTRL_NODE mode starts.

## 1. Check whether the cluster is already created ##
Cluster is already created and configuration file ltfsee_config.filesystem exists.

## 2. Check prerequisite on node ##
Successfully validated the prerequisites.

## 3. IBM Spectrum Scale (GPFS) Configuration for Performance Improvement ##
Setting worker1Threads=400
Setting dmapiWorkerThreads=64
Configured IBM Spectrum Scale (GPFS) performance related settings.

## 4. Configure Space Management ##
Disabling unnecessary daemons...
Editing Space Management Client settings...
Restarting Space Management service...
Terminating dsmwatchd............
Terminating dsmwatchd............
Starting dsmmigfs......................
Configured space management.

### 5. Add this node to a tape library ###

Number of logical libraries with assigned control node: 0
Number of logical libraries available from this node: 1
Number of logical libraries available from this node and with assigned control node: 0

** Select the tape library from the following list
   and input the corresponding number. Then, press Enter.

<table>
<thead>
<tr>
<th>Model</th>
<th>Serial Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 3576-MTL</td>
<td>00000130228 LLC</td>
</tr>
</tbody>
</table>

q. Return to previous menu

Input Number > 1
Input Library Name (alpha numeric or underscore, max 16 characters) > lib_ltfsml1
Added this node (ltfsml1.tuc.stglabs.ibm.com, node id 2) to library lib_ltfsml1
as its control node.

### 6. Add this node to a node group ###

Added this node (ltfsml1.tuc.stglabs.ibm.com, node id 2) to node group G0.

### 7. Add drives to this node ###

** Select tape drives from the following list.
   Input the corresponding numbers and press Enter or press q followed by Enter to quit.
   Multiple tape drives can be specified using comma or white space delimiters.

<table>
<thead>
<tr>
<th>Model</th>
<th>Serial Number</th>

q. Exit from this Menu

Input Number > a
Added the selected drives to this node (ltfsml1.tuc.stglabs.ibm.com, node id 2).

### 8. Configure LE+ component ###

Creating mount point...
Mount point folder '/ltfs' exists.
Use this folder for the LE+ component mount point as LE+ component assumes this folder.
Configured LE+ component.
## 9. Enabling system log ##

Restarting rsyslog...

System log (rsyslog) is enabled for IBM Spectrum Archive Enterprise Edition.

ADD_CTRL_NODE mode completed.

To summarize, EE Node 1 must run `ltfsee_config -m CLUSTER` and `ltfsee_config -m ADD_CTRL_NODE` to complete this single-node configuration.

If you are configuring multiple nodes for IBM Spectrum Archive EE, continue to 5.2.3, “Configuring a multiple-node cluster” on page 92.

### 5.2.3 Configuring a multiple-node cluster ###

To add nodes to form a multiple-node cluster configuration after the first node is configured, complete this task. With the release of IBM Spectrum Archive EE V1.2.4.0, a redundant control node can be set for failover scenarios.

When configuring any multiple-node clusters, set a secondary node as a redundant control node for availability features. The benefits of having redundancy are explained in 6.7, “IBM Spectrum Archive EE automatic node failover” on page 131.

Figure 5-3 shows a multiple-node cluster configuration that is described in this section.

![IBM Spectrum Archive multiple-node cluster configuration](image)

Before configuring more nodes, ensure that all tasks that are described in 5.1, “Configuration prerequisites” on page 78 are completed and that the first node of the cluster environment is configured, as described in 5.2.2, “Configuring a single node cluster” on page 88.
To configure another node for a multi-node cluster setup for IBM Spectrum Archive EE, complete the following steps:

1. Log on to the operating system as a root user.
2. Start GPFS (if it is not already started) by running the following command:
   
   ```bash
   # mmstartup -a
   ```
3. Mount the GPFS file system on all nodes in the IBM Spectrum Scale cluster (if it is not already mounted) by running the following command:
   
   ```bash
   # mmmount all -a
   ```
4. Start the IBM Spectrum Archive EE configuration utility with the `-m ADD_NODE` option by running the following command and answering the prompted questions:
   
   ```bash
   # /opt/ibm/ltfsee/bin/ltfsee_config -m ADD_NODE
   ```

   **Important:** This step must be performed on all nodes except for the first node that was configured in 5.2.2, “Configuring a single node cluster” on page 88.

Example 5-4 shows how to add a secondary node and set it as a redundant control node by running `ltfsee_config -m ADD_NODE`. In step 5 of the command, after selecting which library to add the node to, a prompt will appear asking to make the node a redundant control node. Enter `y` to make the second node a redundant control node. Only two nodes per library can be control nodes. If there are more than two nodes added to the cluster, enter `n` for each additional node.

### Example 5-4 Adding secondary node as a redundant control node

```
[root@ltfsml2 ~]# ltfsee_config -m ADD_NODE
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m ADD_NODE
ADD_NODE mode starts .

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.

## 2. Check prerequisite on node ##
Successfully validated the prerequisites.

## 3. IBM Spectrum Scale (GPFS) Configuration for Performance Improvement ##
Setting workerThreads=512
Setting dmapiWorkerThreads=64
Configured IBM Spectrum Scale (GPFS) preformance related settings.

## 4. Configure space management ##
Disabling unnecessary daemons...
Editing Space Management Client settings...
Deactivating failover operations on the node.
Restarting Space Management service...
Stopping the HSM service.
Terminating dsmwatchd............
Starting the HSM service.
Starting dsmigfs..........................
Activating failover operations on the node.
Configured space management.
```
## 5. Add this node to a tape library ##

The number of logical libraries with the assigned control node: 2
The number of logical libraries available from this node: 1
The number of logical libraries available from this node and with assigned control
node: 1

** Select the tape library from the following list 
and input the corresponding number. Then press Enter. 

<table>
<thead>
<tr>
<th>Library id</th>
<th>Library name</th>
<th>Control node</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 0000013FA0520411</td>
<td>ltfsee_lib 9.11.120.198</td>
<td></td>
</tr>
<tr>
<td>q. Exit from this Menu</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Input Number > 1
Add this node as a control node for control node redundancy(y/n)?

Input > y
The node ltfsml2(9.11.120.201) has been added as a control node for control node redundancy
Added this node (ltfsml2, node id 2) to library ltfsee_lib.

## 6. Add this node to a node group ##

Added this node (ltfsml2, node id 2) to node group G0.

## 7. Add drives to this node ##

** Select tape drives from the following list. 
Input the corresponding numbers and press Enter 
or press 'q' followed by Enter to quit. 
Multiple tape drives can be specified using comma or white space delimiters.

<table>
<thead>
<tr>
<th>Model</th>
<th>Serial Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. ULT3580-TD5</td>
<td>1068093078</td>
</tr>
<tr>
<td>2. ULT3580-TD5</td>
<td>1068093084</td>
</tr>
</tbody>
</table>
| a. Select all tape drives
| q. Exit from this Menu |

Input Number > a
Selected drives: 1068093078:1068093084.
Added the selected drives to this node (ltfsml2, node id 2).

## 8. Configure the LE+ component ##

Creating mount point...
Mount point folder '/ltfs' exists.
Use this folder for the LE+ component mount point as LE+ component assumes this 
folder.
Former saved configuration file exists which holds the following information: 
=== difference /etc/ltfs.conf.local.rpmsave from /etc/ltfs.conf.local ===

=== end of difference ===
Do you want to use the saved configuration (y/n)?
Input > y
The LE+ component configuration is restored from a saved configuration.
Configured the LE+ component.

ADD_NODE mode completed.

To summarize, you ran the following configuration options on EE Node 1 in 5.2.2, “Configuring a single node cluster” on page 88:

- ltfsee_config -m CLUSTER
- ltfsee_config -m ADD_CTRL_NODE

For each additional IBM Spectrum Archive node in EE Node Group 1, run the ltfsee_config -m ADD_NODE command. For example, in Figure 5-3 on page 92, you must run ltfsee_config -m ADD_NODE on both EE Node 2 and EE Node 3.

If you require multiple tape library attachments, go to 5.2.4, “Configuring a multiple-node cluster with two tape libraries” on page 95.

5.2.4 Configuring a multiple-node cluster with two tape libraries

Starting with IBM Spectrum Archive V1R2, IBM Spectrum Archive supports the Multiple Tape Library Attachment feature in a single IBM Spectrum Scale cluster. This feature allows for data replication to pools in separate libraries for more data resiliency, and allows for total capacity expansion beyond a single library limit.

The second tape library can be the same tape library model as the first tape library or can be a different tape library model. These two tape libraries can be connected to an IBM Spectrum Scale cluster in a single site or can be placed in metro distance (less than 300 km) locations through IBM Spectrum Scale synchronous mirroring (stretched cluster).

For more information about synchronous mirroring by using IBM Spectrum Scale replication, see IBM Knowledge Center.

Important: Stretched cluster is available for distances shorter than 300 km. For longer distances, the Active File Management (AFM) feature of IBM Spectrum Scale should be used with IBM Spectrum Archive. The use of AFM is with two different IBM Spectrum Scale clusters with one instance of IBM Spectrum Archive at each site. For more information about IBM Spectrum Scale AFM support, see 2.2.5, “Active File Management” on page 32.
To add nodes to form a multiple-node cluster configuration with two tape libraries after the first node is configured, complete this task. Figure 5-4 shows the configuration with two tape libraries.

Before configuring more nodes, ensure that all tasks that are described in 5.1, “Configuration prerequisites” on page 78 are completed and that the first node of the cluster environment is configured, as described in 5.2.2, “Configuring a single node cluster” on page 88.

To configure the nodes at the other location for a multiple-node two-tape library cluster setup for IBM Spectrum Archive EE, complete the following steps:

1. Run the IBM Spectrum Archive EE configuration utility by running the following command and answering the prompted questions:

   ```
   # /opt/ibm/ltfsee/bin/ltfsee_config -m ADD_CTRL_NODE
   ```

   Using Figure 5-4 as an example, the `ltfsee_config -m ADD_CTRL_NODE` command is run on EE Node 4.

2. Run the IBM Spectrum Archive EE configuration utility on all the remaining EE nodes at the other location by running the following command and answering the prompted questions:

   ```
   # /opt/ibm/ltfsee/bin/ltfsee_config -m ADD_NODE
   ```

   Using Figure 5-4 as an example, the `ltfsee_config -m ADD_NODE` command is run on EE Node 5 and EE Node 6.

### 5.2.5 Modifying a multiple-node configuration for control node redundancy

If users are upgrading to the IBM Spectrum Archive EE V1.3.0.0 from a previous version and have a multiple-node configuration with no redundant control nodes, users must manually set a redundant control node. See 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58 on how to perform upgrades. To modify the configuration to set a secondary node to be a redundant control node, IBM Spectrum Archive EE must not be running.
Run `eadm cluster stop`, to stop IBM Spectrum Archive EE and LE+. After IBM Spectrum Archive EE has stopped, run `ltfsee_config -m SET_CTRL_NODE` to modify the configuration to add a redundant control node.

Example 5-5 shows the output of `ltfsee_config -m SET_CTRL_NODE` to create a redundant control node. In this example, the cluster has two libraries connected and will only perform setting a redundant control node on one of the two libraries. Repeat the same steps and select the second library to make a redundant control node for the second library.

**Example 5-5  Setting existing node to be redundant control node**

```
[root@ltfsml1 ~]# ltfsee_config -m SET_CTRL_NODE
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m
SET_CTRL_NODE
SET_CTRL_NODE mode starts.

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem
exists.

## 2. Control node configuration.

** Select a library to set control nodes.

Libraries
1:0000013FA0520411
2:0000013FA0520412
q.Quit

Input number >1
Set the control nodes for the library 0000013FA0520411.

** Select 1 or 2 nodes for redundant control nodes from the following list.
They can be specified using comma or white space delimiters.
Nodes marked [x] are the current redundant configured nodes.

Nodes
1:[x]ltfsml1
2:[_]ltfsml2
q.Quit

Input number >1 2

## 3. Select control node to be active ##
The following nodes are selected as redundant nodes.
Select a node that will be active in the next LTFS-EE run.

Nodes
1:ltfsml1
2:ltfsml2
q.Quit

Input number >1

The node ebisu(9.11.120.198) has been set to be active for library ltfsee_lib
After successfully setting up redundant control nodes for each library cluster, start Spectrum Archive EE by running the `eeadm cluster start` command. Then, run `eeadm node list` to verify that each node was started up properly and is available. You should also see that there are two control nodes per library. Example 5-6 shows output from a multiple-node configuration with two tape libraries.

Example 5-6  `eeadm node list`

```
[root@ltfsml1 ~]# eeadm node list

<table>
<thead>
<tr>
<th>Node ID</th>
<th>State</th>
<th>Node IP</th>
<th>Drives</th>
<th>Ctrl Node</th>
<th>Library</th>
<th>Node Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Available</td>
<td>9.11.120.224</td>
<td>2</td>
<td>Yes</td>
<td>ltfssee_lib2</td>
<td>G0</td>
</tr>
<tr>
<td>3</td>
<td>Available</td>
<td>9.11.120.207</td>
<td>2</td>
<td>Yes(Active)</td>
<td>ltfssee_lib2</td>
<td>G0</td>
</tr>
<tr>
<td>2</td>
<td>Available</td>
<td>9.11.120.201</td>
<td>2</td>
<td>Yes</td>
<td>ltfssee_lib1</td>
<td>G0</td>
</tr>
<tr>
<td>1</td>
<td>Available</td>
<td>9.11.120.198</td>
<td>2</td>
<td>Yes(Active)</td>
<td>ltfssee_lib1</td>
<td>G0</td>
</tr>
</tbody>
</table>
```

5.3 First-time start of IBM Spectrum Archive EE

To start IBM Spectrum Archive EE the first time, complete the following steps:

1. Check that the following embedded, customized Tivoli Storage Manager for Space Management (HSM) client components are running on each Spectrum Archive EE node:

   ```
   # ps -ef | grep dsm
   ```

2. Start the IBM Spectrum Archive EE program by running the following command:

   ```
   /opt/ibm/ltfsee/bin/eeadm cluster start
   ```

   **Important:** If the `eeadm cluster start` command does not return after several minutes, it might be either because tapes are being unloaded or because the firewall is running. The firewall service must be disabled on the IBM Spectrum Archive EE nodes. For more information, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

Example 5-7 shows all of the steps and the output when IBM Spectrum Archive EE was started the first time. During the first start, you might discover a warning message, as shown in the following example:

The authenticity of host 'localhost (::1)' can't be established.
Are you sure you want to continue connecting (yes/no)?

This message is normal during the first start and you can easily continue by entering yes and pressing Enter.

Example 5-7  Start IBM Spectrum Archive EE the first time

```
[root@ltfsml1 ~]# ps -afe | grep dsm
root  14351     1  0 15:33 ?      00:00:01 /opt/tivoli/tsm/client/hsm/bin/dsmwatchd nodetach
root  15131 30301  0 16:33 pts/0      00:00:00 grep --color=auto dsm
```
5.3.1 Configuring a Centralized Archive Repository solution

A Centralized Archive Repository solution consists of having IBM Spectrum Archive EE at just the home cluster of IBM Spectrum Scale AFM. The steps in this section show how to set up a home site with IBM Spectrum Archive EE, and how to set up the cache site and link them. For more information on use cases, see Figure 8-11 on page 257.
Steps 1 - 5 demonstrate how to set up a IBM Spectrum Scale AFM home cluster and start IBM Spectrum Archive EE. Steps 6 - 9 show how to set up the IW caches for IBM Spectrum Scale AFM cache clusters:

1. If IBM Spectrum Scale is not already active and GPFS is not already mounted, start IBM Spectrum Scale and wait until the cluster becomes active. Then, mount the file system if it is not set to mount automatically using the commands in Example 5-8.

   Example 5-8   Starting and mounting IBM Spectrum Scale and GPFS file system

   ```
   [root@ltfseehomesrv ~]# mmstartup -a
   Tue Mar 21 14:37:57 MST 2017: mmstartup: Starting GPFS ...
   [root@ltfseehomesrv ~]# mmgetstate -a
   Node number Node name        GPFS state
   ------------------------------------------
   1      ltfseehomesrv arbitrating
   [root@ltfseehomesrv ~]# mmgetstate -a
   Node number Node name        GPFS state
   ------------------------------------------
   1      ltfseehomesrv active
   [root@ltfseehomesrv ~]# mmmount all -a
   Tue Mar 21 14:40:36 MST 2017: mmmount: Mounting file systems ...
   [root@ltfseecachesrv ~]# systemctl start hsm
   [root@ltfseecachesrv ~]# dsmmigfs start
   IBM Spectrum Protect
   Command Line Space Management Client Interface
   Client Version 8, Release 1, Level 0.0
   Client date/time: 03/22/2017 13:41:41
   (c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
   [root@ltfseecachesrv ~]# dsmmigfs enablefailover
   IBM Spectrum Protect
   Command Line Space Management Client Interface
   Client Version 8, Release 1, Level 0.0
   Client date/time: 03/22/2017 13:41:41
   (c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
   ```

   Note: Step 2 assumes that the user has already created their file set and linked it to the GPFS file system. The following examples use IWhome as the home file set.

2. After IBM Spectrum Scale is active and the GPFS file system is mounted, edit the NFS exports file (/etc/exports) to include the new file set. It is important that the no_root_squash, sync, and rw arguments are used. Example 5-9 shows example content of the exports file for file set IWhome.

   Example 5-9   Contents of an exports file

   ```
   [root@ltfseehomesrv ~]# cat /etc/exports
   /ibm/glues/IWhome *(rw,sync,no_root_squash,ohide,insecure,no_subtree_check,fsid=125)
   ```
3. After the exports file has been modified to include the file set, start the NFS service. Example 5-10 shows an example of starting and checking the NFS service.

Example 5-10  Starting and checking the status of NFS service

[root@ltfseehomesrv ~]# systemctl start nfs
[root@ltfseehomesrv ~]# systemctl status nfs
nfs-server.service - NFS server and services
   Loaded: loaded (/usr/lib/systemd/system/nfs-server.service; enabled; vendor preset: disabled)
   Active: active (exited) since Tue 2017-03-21 15:58:43 MST; 2s ago
   Process: 1895 ExecStopPost=/usr/sbin/exportfs -f (code=exited, status=0/SUCCESS)
   Process: 1891 ExecStopPost=/usr/sbin/exportfs -au (code=exited, status=0/SUCCESS)
   Process: 1889 ExecStop=/usr/sbin/rpc.nfsd 0 (code=exited, status=0/SUCCESS)
   Process: 10062 ExecStart=/usr/sbin/rpc.nfsd $RPCNFSDARGS (code=exited, status=0/SUCCESS)
   Process: 10059 ExecStartPre=/usr/sbin/exportfs -r (code=exited, status=0/SUCCESS)
   Main PID: 10062 (code=exited, status=0/SUCCESS)
   CGroup: /system.slice/nfs-server.service

Mar 21 15:58:43 ltfseehomesrv.tuc.stglabs.ibm.com systemd[1]: Starting NFS server and services...

4. After NFS has properly started the final step to configure IBM Spectrum Scale AFM at the home cluster is to enable the exported path. Run `mmafconfig enable <path-to-fileset>` to enable the exported file set. Example 5-11 shows the execution of the `mmafconfig` command with the IWhome file set.

Example 5-11  Execution of mmafconfig enable <path-to-fileset>

[root@ltfseehomesrv ~]# mmafconfig enable /ibm/glues/IWhome/
[root@ltfseehomesrv ~]#

5. After the file set has been enabled for AFM proceed by starting up IBM Spectrum Archive if it has not been started previously by running `eadm cluster start`.

Run the next four steps on the designated cache nodes:

6. Before starting IBM Spectrum Scale on the cache clusters, determine which nodes will become the gateway nodes and then run the `mmchnode --gateway -N <node1,node2,etc..>` command to create gateway nodes. Example 5-12 shows the output of running `mmchnode` on one cache node.

Example 5-12  Setting gateway nodes for cache clusters

[root@ltfseecachesrv ~]# mmchnode --gateway -N ltfseecachesrv

Note: The fsid in the exports file needs to be a unique number different than any other export clause within the exports file.
7. After all the gateway nodes have been set, start IBM Spectrum Scale and mount the file system if it is not done automatically, as shown in Example 5-13:

a. `mmmstartup -a`

b. `mmgetstate -a`

c. `mmount all -a` (optional, only if the GPFS file system is not mounted automatically)

Example 5-13  Starting and mounting IBM Spectrum Scale and GPFS file system

```
[root@ltfseecachesrv ~]# mmstartup -a
Tue Mar 21 14:37:57 MST 2017: mmstartup: Starting GPFS ...
[root@ltfseecachesrv ~]# mmgetstate -a

Node number    Node name        GPFS state
------------------------------------------
 1    ltfseecachesrv  arbitrating

[root@ltfseecachesrv ~]# mmgetstate -a

Node number    Node name        GPFS state
------------------------------------------
 1    ltfseecachesrv1  active
```

8. After IBM Spectrum Scale has been started and the GPFS file system is mounted, then create the cache fileset by using `mmcrfileset` with the `afmTarget`, `afmMode`, and `inode-space` parameters. Example 5-14 shows the execution of `mmcrfileset` to create a cache fileset.

Example 5-14  Creating a cache fileset that targets the home fileset

```
[root@ltfseecachesrv ~]# mmcrfileset gpfs iwcache -p afmMode=iw -p afmTarget=ltfseehomesrv:/ibm/glues/IWhome --inode-space=new
Fileset iwcache created with id 1 root inode 4194307.
```

9. After the fileset is created, it can be linked to a directory in the GPFS file system by running the `mmlinkfileset <device> <fileset> -J <gpfs file system/fileset name>` command. Example 5-15 shows output of running `mmlinkfileset`.

Example 5-15  Linking the GPFS fileset to a directory on the GPFS file system

```
[root@ltfseecachesrv ~]# mmlinkfileset gpfs iwcache -J /ibm/glues/iwcache
Fileset iwcache linked at /ibm/glues/iwcache
```

Steps 6 - 9 need to be run on each cache cluster that will be linked to the home cluster. After completing these steps, IBM Spectrum Scale AFM and IBM Spectrum Archive EE are set up on the home cluster and IBM Spectrum Scale AFM is set up on each cache cluster. The system is ready to perform centralized archiving and caching.
5.3.2 Configuring an Asynchronous Archive Replication solution

An Asynchronous Archive Replication solution consists of having IBM Spectrum Archive EE at both the home and cache cluster for IBM Spectrum Scale AFM. This section demonstrates how to set up IBM Spectrum Scale AFM with IBM Spectrum Archive EE to create an Asynchronous Archive Replication solution. For more information on use cases, see 8.9.2, “Asynchronous Archive Replication” on page 257.

Steps 1 - 5 demonstrate how to set up a IBM Spectrum Scale AFM home cluster and start IBM Spectrum Archive EE. Steps 6 - 11 demonstrate how to set up the cache clusters, and steps 12 - 15 demonstrate how to reconfigure Spectrum Archive EE’s configuration to work with IBM Spectrum Scale AFM.

1. If IBM Spectrum Archive is not already active and GPFS is not already mounted, start the file system and wait until the file system becomes active. Then, mount the file system if it is not set to mount automatically using the commands in Example 5-16.

Example 5-16  Starting and mounting IBM Spectrum Scale and GPFS file system

```
[root@ltfseehomesrv ~]# mmstartup -a
Tue Mar 21 14:37:57 MST 2017: mmstartup: Starting GPFS ...
[root@ltfseehomesrv ~]# mmgetstate -a

Node number  Node name        GPFS state
------------------------------------------
 1      ltfseehomesrv arbitrating

[root@ltfseehomesrv ~]# mmgetstate -a

Node number  Node name        GPFS state
------------------------------------------
 1      ltfseehomesrv active

[root@ltfseehomesrv ~]# systemctl start hsm
[root@ltfseehomesrv ~]# dsmmigfs start
IBM Spectrum Protect
Command Line Space Management Client Interface
Client Version 8, Release 1, Level 0.0
Client date/time: 03/22/2017 13:41:36
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
[root@ltfseehomesrv ~]# dsmmigfs enablefailover
IBM Spectrum Protect
Command Line Space Management Client Interface
Client Version 8, Release 1, Level 0.0
Client date/time: 03/22/2017 13:41:41
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

Automatic failover is enabled on this node in mode   ENABLED.
```

Note: Step 2 assumes that the user has already created their fileset and linked it to the GPFS file system. The following examples use IWhome as the home fileset.
2. After IBM Spectrum Scale is active and the GPFS file system is mounted, edit the NFS exports file (/etc/exports) to include the new fileset. It is important that the no_root_squash, sync, and rw arguments are used. Example 5-17 shows example content of the exports file for fileset IWhome.

Example 5-17  Contents of an exports file

```
[root@ltfseehomesrv ~]# cat /etc/exports
/ibm/glues/IWhome *(rw,sync,no_root_squash,nohide,insecure,no_subtree_check/fsid=125)
```

**Note:** The fsid in the exports file needs to be a unique number different than any other export clause within the exports file.

3. After the exports file has been modified to include the fileset, start the NFS service. Example 5-18 shows an example of starting and checking the NFS service.

Example 5-18  Starting and checking the status of NFS service

```
[root@ltfseehomesrv ~]# systemctl start nfs
[root@ltfseehomesrv ~]# systemctl status nfs
? nfs-server.service - NFS server and services
 Loaded: loaded (/usr/lib/systemd/system/nfs-server.service; enabled; vendor preset: disabled)
 Active: active (exited) since Tue 2017-03-21 15:58:43 MST; 2s ago
   Process: 1895 ExecStopPost=/usr/sbin/exportfs -f (code=exited, status=0/SUCCESS)
   Process: 1891 ExecStopPost=/usr/sbin/exportfs -au (code=exited, status=0/SUCCESS)
   Process: 1889 ExecStop=/usr/sbin/rpc.nfsd 0 (code=exited, status=0/SUCCESS)
   Process: 10062 ExecStart=/usr/sbin/rpc.nfsd $RPCNFSDARGS (code=exited, status=0/SUCCESS)
   Process: 10059 ExecStartPre=/usr/sbin/exportfs -r (code=exited, status=0/SUCCESS)
 Main PID: 10062 (code=exited, status=0/SUCCESS)
 CGroup: /system.slice/nfs-server.service

Mar 21 15:58:43 ltfseehomesrv.tuc.stglabs.ibm.com systemd[1]: Starting NFS server and services...
```

4. After NFS has properly started, the final step to configure IBM Spectrum Scale AFM at the home cluster is to enable the exported path. Run `mmafmconfig enable <path-to-fileset>` to enable the exported fileset. Example 5-19 shows the execution of the `mmafmconfig` command with the IWhome fileset.

Example 5-19  Execution of mmafmconfig enable <path-to-fileset>

```
[root@ltfseehomesrv ~]# mmafmconfig enable /ibm/glues/IWhome/
[root@ltfseehomesrv ~]#
```

5. After the fileset has been enabled for AFM, start Spectrum Archive if it has not been started previously by running `eadm cluster start`. 
After the home cluster is set up and an NFS export directory is enabled for IBM Spectrum Scale AFM, steps 6 - 11 demonstrate how to set up a Spectrum Scale AFM IW cache fileset at a cache cluster and connect the cache’s fileset with the home’s fileset. Steps 12 - 15 show how to modify IBM Spectrum Archive EE’s configuration to allow cache filesets.

6. If IBM Spectrum Archive EE is active, properly shut it down by using the commands in Example 5-20.

Example 5-20  Shutting down IBM Spectrum Archive EE

```
[root@ltfseecachesrv ~]# eeadm cluster stop
Library name: libb, library serial: 0000013400190402, control node (ltfsee_md)
IP address: 9.11.244.46.
Stopping - sending request and waiting for the completion.
Stopped the IBM Spectrum Archive EE services for library libb.
[root@ltfseecachesrv ~]# pidof mmm
[root@ltfseecachesrv ~]# umount /ltfs
[root@ltfseecachesrv ~]# pidof ltfs
[root@ltfseecachesrv ~]#
```

7. If IBM Spectrum Scale is active, properly shut it down by using the commands in Example 5-21.

Example 5-21  Shutting down IBM Spectrum Scale

```
[root@ltfseecachesrv ~]# dsmmigfs disablefailover
IBM Spectrum Protect
Command Line Space Management Client Interface
Client Version 8, Release 1, Level 0.0
Client date/time: 03/22/2017 13:31:14
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

Automatic failover is disabled on this node.
[root@ltfseecachesrv ~]# dsmmigfs stop
IBM Spectrum Protect
Command Line Space Management Client Interface
Client Version 8, Release 1, Level 0.0
Client date/time: 03/22/2017 13:31:19

ltfseecachesrv.tuc.stglabs.ibm.com: Unloading module mmfs26
ltfseecachesrv.tuc.stglabs.ibm.com: Unloading module mmfslinux
```
8. With IBM Spectrum Archive EE and IBM Spectrum Scale both shut down, set the gateway nodes if they have not been set when IBM Spectrum Scale was configured by using the command in Example 5-22.

Example 5-22  Setting a gateway node

```
[root@ltfseecachesrv ~]# mmchnode --gateway -N ltfseecachesrv
Tue Mar 21 16:49:16 MST 2017: mmchnode: Processing node
ltfseecachesrv.tuc.stglabs.ibm.com
[root@ltfseecachesrv ~]#
```

9. Properly start IBM Spectrum Scale by using the commands in Example 5-23.

Example 5-23  Starting IBM Spectrum Scale

```
[root@ltfseecachesrv ~]# mmstartup -a
Wed Mar 22 13:41:02 MST 2017: mmstartup: Starting GPFS ...
[root@ltfseecachesrv ~]# mmmount all -a
Wed Mar 22 13:41:22 MST 2017: mmmount: Mounting file systems ...
[root@ltfseecachesrv ~]# systemctl start hsm
[root@ltfseecachesrv ~]# dsmmigfs start
IBM Spectrum Protect
Command Line Space Management Client Interface
  Client Version 8, Release 1, Level 0.0
  Client date/time: 03/22/2017 13:41:36
  (c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
[root@ltfseecachesrv ~]# dsmmigfs enablefailover
IBM Spectrum Protect
Command Line Space Management Client Interface
  Client Version 8, Release 1, Level 0.0
  Client date/time: 03/22/2017 13:41:41
  (c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

Automatic failover is enabled on this node in mode  ENABLED.
```

10. Create the independent-writer fileset by using the command in Example 5-24.

Example 5-24  Creating an IW fileset

```
[root@ltfseecachesrv ~]# mmcrfileset gpfs iwcache -p afmmode=independent-writer
-p afmtarget=ltfseehomesrv:/ibm/glues/IWhome --inode-space=new
Fileset iwcache created with id 1 root inode 4194307.
[root@ltfseecachesrv ~]#
```

11. Link the fileset to a directory on the node's GPFS file system by using the command in Example 5-25.

Example 5-25  Linking an IW fileset

```
[root@ltfseecachesrv ~]# mmlinkfileset gpfs iwcache -J /ibm/glues/iwcache
Fileset iwcache linked at /ibm/glues/iwcache
[root@ltfseecachesrv ~]#
```

IBM Spectrum Scale AFM is now configured and has a working home and IW cache clusters.
12. With IBM Spectrum Archive EE still shut down, obtain the metadata and HSM file systems IBM Spectrum Archive EE by using the command in Example 5-26.

**Example 5-26  Obtaining metadata and HSM file system(s)**

```
[root@ltfseecachesrv ~]# ltfsee_config -m INFO
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m INFO
INFO mode starts .

## 1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.
Metadata Filesystem:
/ibm/glues
HSM Filesystems:
/ibm/glues
Library: Name=ltfsee_lib1, S/N=0000013400190402
Node Group: Name=ltfseecachesrv
    Node: ltfseecachesrv.tuc.stglabs.ibm.com
    Drive: S/N=00078000BC, Attribute='mrg'
    Drive: S/N=00078000BD, Attribute='mrg'
Pool: Name=copy_cache, ID=902b097a-7a34-4847-a346-0e6d97444a21
    Tape: Barcode=DV1982L7
    Tape: Barcode=DV1985L7
Pool: Name=primary_cache, ID=14ad6b6cf-d1f5-46ef-a0bb-7b38b1bda4ec
    Tape: Barcode=DV1983L7
    Tape: Barcode=DV1984L7
```

13. Modify IBM Spectrum Archive EE’s configuration by using the command that is shown in Example 5-27 with the same file systems that were recorded from step 7.

**Example 5-27  Modify IBM Spectrum Archive EE configuration for IBM Spectrum Scale AFM**

```
[root@ltfseecachesrv ~]# ltfsee_config -m UPDATE_FS_INFO
The EE configuration script is starting: /opt/ibm/ltfsee/bin/ltfsee_config -m UPDATE_FS_INFO
UPDATE_FS_INFO mode starts .

## Step-1. Check to see if the cluster is already created ##
The cluster is already created and the configuration file ltfsee_config.filesystem exists.
Successfully validated the prerequisites.
** Select file systems to configure for the IBM Spectrum Scale (GPFS) file system for Space Management.**

Input the corresponding numbers and press Enter
or press 'q' followed by Enter to quit.
Press a followed by Enter to select all file systems.
Multiple file systems can be specified using comma or white space delimiters.
File system
1. /dev/flash Mount point(/flash)
2. /dev/gpfs Mount point(/ibm/gpfs)
   a. Select all file systems
   q. Quit
Input number > a

## Step-2. Add selected file systems to Space Management ##
Added the selected file systems to the space management.

## Step-3. Store the file systems configuration and dispatch it to all nodes ##
Storing the file systems configuration.
Copying ltfsee_config.filesystem file.
Stored the cluster configuration and dispatched the configuration file.
Disabling runtime AFM file state checking.
UPDATE_FS_INFO mode completed.

```
Example 5-28  Start IBM Spectrum Archive EE

[root@ltfseeecachesrv ~]# eeadm cluster start
Library name: libb, library serial: 0000013400190402, control node (ltfsee_md)
IP address: 9.11.244.46.
Starting - sending a startup request to libb.
Starting - waiting for startup completion : libb.
Starting - opening a communication channel : libb.
Starting - waiting for getting ready to operate : libb.

.................................................................

Started the IBM Spectrum Archive EE services for library libb with good status.
```

15. At the start of IBM Spectrum Archive EE, the AFMSKIPUNCACHEDFILES flag inside the
/opt/tivoli/tsm/client/ba/bin/dsm.sys file should be set to yes. It can be checked by
using the command in Example 5-29. If it has not been properly set, modify the file so that
the AFMSKIPUNCACHEDFILES is set to yes.

```
Example 5-29  Validating AFMSKIPUNCACHEDFILES is set to yes

[root@ltfseeecachesrv ~]# grep AFMSKIPUNCACHEDFILES
/opt/tivoli/tsm/client/ba/bin/dsm.sys
AFMSKIPUNCACHEDFILES YES
```

After successfully completing these steps, IBM Spectrum Archive EE and IBM Spectrum
Scale AFM are set up at both the home and cache cluster. They can now be used as an
Asynchronous Archive Replication solution.
In this chapter, the day-to-day management of the IBM Spectrum Archive Enterprise Edition (IBM Spectrum Archive EE) environment is described.

This chapter includes the following topics:

- 6.1, “Overview” on page 111
- 6.2, “Status information” on page 116
- 6.3, “Upgrading components” on page 121
- 6.4, “Starting and stopping IBM Spectrum Archive EE” on page 125
- 6.5, “Task command summaries” on page 126
- 6.6, “IBM Spectrum Archive EE database backup” on page 130
- 6.7, “IBM Spectrum Archive EE automatic node failover” on page 131
- 6.8, “Tape library management” on page 132
- 6.9, “Tape storage pool management” on page 140
- 6.10, “Pool capacity monitoring” on page 142
- 6.11, “Migration” on page 143
- 6.12, “Premigration” on page 162
- 6.13, “Preserving file system objects on tape” on page 164
- 6.14, “Recall” on page 167
- 6.15, “Recalling files to their resident state” on page 171
- 6.16, “Reconciliation” on page 171
- 6.17, “Reclamation” on page 174
- 6.18, “Checking and repairing tapes” on page 175
- 6.19, “Importing and exporting” on page 177
- 6.20, “Drive Role settings for task assignment control” on page 181
- 6.21, “Tape drive intermix support” on page 183
- 6.22, “Obtaining the location of files and data” on page 188
- 6.23, “Obtaining system resources, and tasks information” on page 189
- 6.24, “Monitoring the system with SNMP” on page 191
- 6.25, “Configuring Net-SNMP” on page 193
- 6.26, “IBM Spectrum Archive REST API” on page 194
**Note:** In our lab setup for writing this book, we used a Red Hat-based Linux system. The figures that are used in this chapter are based on the Version 1 Release 2 of the product. Although the steps that you perform are the same, you might see slightly different output responses in your window, depending on your version and release of the product.
6.1 Overview

The following terms specific to IBM Spectrum Archive EE operations are used in this chapter:

**Migration** The movement of files from the IBM Spectrum Scale file system on disk to IBM Linear Tape File System tape cartridges, which leaves behind a stub file.

**Premigration** The movement of files from GPFS file systems on disk to LTFS tape cartridges without replacing them with stub files on the GPFS file system. Identical copies of the files are on the GPFS file system and in LTFS storage.

**Recall** The movement of migrated files from tape cartridges back to the originating GPFS file system on disk, which is the reverse of migration.

**Reconciliation** The process of synchronizing a GPFS file system with the contents of an LTFS tape cartridge and removing old and obsolete objects from the tape cartridge. You must run reconciliation when a GPFS file is deleted, moved, or renamed.

**Reclamation** The process of defragmenting a tape cartridge. The space on a tape cartridge that is occupied by deleted files is not reused during normal LTFS operations. New data is always written after the last index on tape. The process of reclamation is similar to the same named process in IBM Tivoli Storage Manager from the IBM Spectrum Archive family. All active files are consolidated onto a second tape cartridge, which improves overall tape usage.

**Library rescan** The process of triggering IBM Spectrum Archive EE to retrieve information about physical resources from the tape library. This process is scheduled to occur automatically at regular intervals, but can be run manually.

**Tape validate** The process of checking a tape for errors when it is added to a tape cartridge pool.

**Tape replace** The process of repairing any errors that are found on the tape during the tape check process.

**Import** The addition of an LTFS tape cartridge to IBM Spectrum Archive EE.

**Export** The removal of an LTFS tape cartridge from IBM Spectrum Archive EE.

**Data migration** The new method of technology migration of tape drives and cartridges. There are two ways to perform data migration:

- within a pool
- pool to pool

6.1.1 IBM Spectrum Archive EE command summaries

Use IBM Spectrum Archive EE commands to configure IBM Spectrum Archive EE tape cartridge pools and perform IBM Spectrum Archive EE administrative tasks. The commands use the following two syntaxes:

```
eeadm <resource_type> <action> [options],
eeadm <subcommand> [options].
```
The following `eeadm` command options are available. All options, except listing resource types, can be run only with root user permissions:

- **`eeadm cluster start`**
  Use this command to start the process of the IBM Spectrum Archive EE system on all configured servers, or on a specific library.

  **Important:** If the `eeadm cluster start` command does not return after several minutes, it might be because the firewall is running or tapes are being unmounted from the drives. The firewall service must be disabled on the IBM Spectrum Archive EE nodes. For more information, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

- **`eeadm cluster stop`**
  Use this command to Stop the process of the IBM Spectrum Archive EE system on all configured servers, or on a specific library.

- **`eeadm cluster failover`**
  Use this command to manually initiate a node failover process.

- **`eeadm cluster set`**
  Use this command to change the global configuration attributes of IBM Spectrum Archive cluster.

- **`eeadm cluster show`**
  Use this command to display the global configuration attributes of IBM Spectrum Archive cluster.

- **`eeadm drive assign`**
  Use this command to assign tape drive(s) to the IBM Spectrum Archive EE server.

- **`eeadm drive unassign`**
  Use this command to unassign tape drive(s) from the IBM Spectrum Archive EE server.

- **`eeadm drive up`**
  Use this command to enable a tape drive. The enabled drive can be used as a part of the IBM Spectrum Archive EE system.

- **`eeadm drive down`**
  Use this command to disable a tape drive. The disabled drive cannot be used as a part of the IBM Spectrum Archive EE system.

- **`eeadm drive list`**
  Use this command to list all the configured tape drives.

- **`eeadm drive set`**
  Use this command to change the configuration attributes of a tape drive.

- **`eeadm drive show`**
  Use this command to display the configuration attributes of a tape drive.

- **`eeadm file state`**
  Use this command to display the current data placement of files. Each file is in one of the following states:
    - **resident**: The data is on disk
– **premigrated**: The data is both on disk and tape(s)
– **migrated**: The data is on tape(s) while its stub file remains on disk.

- **eeadm library list**
  Use this command to list all the managed tape libraries.

- **eeadm library rescan**
  Use this command to force the tape library to check and report its physical resources, and update the resource information kept in IBM Spectrum Archive EE.

- **eeadm library show**
  Use this command to display the configuration attributes of a tape library.

- **eeadm node down**
  Use this command to disable one of the IBM Spectrum Archive EE servers temporarily for maintenance. The disabled node does not participate in the system.

- **eeadm node list**
  Use this command to list the configuration and status of all the configured nodes.

- **eeadm node show**
  Use this command to display the configuration attributes of the node.

- **eeadm node up**
  Use this command to enable one of the IBM Spectrum Archive EE servers. The enabled node can be used as a part of the IBM Spectrum Archive EE system.

- **eeadm nodegroup list**
  Use this command to list all the configured node groups.

- **eeadm pool create**
  Use this command to create a new tape pool.

- **eeadm pool delete**
  Use this command to delete an existing tape pool which no tapes are assigned.

- **eeadm pool list**
  Use this command to list all the configured tape pools.

- **eeadm pool set**
  Use this command to change the configuration attributes of a pool.

- **eeadm pool show**
  Use this command to display the configuration attributes of the tape pool.

- **eeadm tape list**
  Use this command to list the configuration and status of all the tapes.

- **eeadm tape set**
  Use this command to change the configuration attribute of a tape.

- **eeadm tape show**
  Use this command to display the configuration attributes of a tape that is already assigned to the tape pool.
- **`eeadm tape assign`**
  Use this command to format the tape(s) and assign it to the tape pool. The command fails if it contains any file object unless the `-f` option is used. Use the `eeadm tape import` command to make the tape that contains files a new member of the pool.

- **`eeadm tape export`**
  Use this command to export the tape permanently from the IBM Spectrum Archive EE system and purges the GPFS files referring to the tape. The command internally runs the reconciliation process and identifies the active GPFS files in migrated or premigrated states. If a file refers to the tape to be exported and if the tape contains the last replica of the file, it deletes the GPFS file. After the successful completion of the command, the tape is unassigned from the tape pool, and the tape state becomes *exported*. Prior to running this command, all GPFS file systems must be mounted so that the command is able to check for the existence of the files on disk.

- **`eeadm tape import`**
  Use this command to import tapes created and managed by other system to the IBM Spectrum Archive EE system, and makes the files on tape accessible from the GPFS namespace. The command will create the stub files and leave the files in the migrated state without transferring the file data back to disk immediately.

- **`eeadm tape move`**
  Use this command to move the tape physically within the tape library. The command can move the tape to its home slot either from the tape drive or from the I/E slot (or I/O station) of the tape library. It can move the tape to I/E slot if the tape is:
  - in the offline state
  - the tape belongs to a tape pool that is undergoing pool relocation.

- **`eeadm tape offline`**
  Use this command to set the tape to the offline state to prepare for moving the tape temporarily out of the tape library, until access to the data is required. The tape needs to come back to the original IBM Spectrum Archive EE system by using the `eeadm tape online` command.

- **`eeadm tape online`**
  Use this command to make the offline tape accessible from the IBM Spectrum Archive EE system.

- **`eeadm tape unassign`**
  Use this command to unassign the member tape(s) from the tape pool.

- **`eeadm tape datamigrate`**
  Use this command to move the active contents of specified tapes to a different tape pool and updates the stub files on disk to point to the new data location. After the successful completion of the command, the tape is automatically unassigned from the source tape pool. The `datamigrate` command can be used to move the data on older technology tapes in the source tape pool to newer technology tapes in the destination tape pool.

- **`eeadm tape reclaim`**
  Use this command to reclaim the unreferenced space of the specified tapes. It moves the active contents on the tapes to different tapes, then recycles the specified tapes. After the successful completion of the command, the tape is automatically unassigned from the tape pool.
- **eeadm tape reconcile**
  Use this command to compare the contents of the tape with the files on the GPFS file systems, and reconciles the differences between them.

- **eeadm tape replace**
  Use this command to move the contents of a tape that previously suffered some error to another tape in the same pool. This command is used on tapes in the `require_replace` or `need_replace` state. After the successful completion of the replacement process, the tape that had the error is automatically unassigned from the tape pool.

- **eeadm tape validate**
  Use this command to validate the current condition of a tape by loading it to the tape drive, and update the tape state. The tape must be a member of the tape pool and online.

- **eeadm task cancel**
  Use this command to cancel the active task. The command supports the cancellation of reclaim and datamigrate tasks only.

- **eeadm task clearhistory**
  Use this command to delete the records of completed tasks to free up disk space.

- **eeadm task list**
  Use this command to list the active or completed tasks.

- **eeadm task show**
  Use this command to show the detailed information of the specified task.

- **eeadm migrate**
  Use this command to move the file data to the tape pool(s) to free up disk space, and sets the file state to `migrated`.

- **eeadm premigrate**
  Use this command to copy the file data to the tape pool(s), and sets the file state to `premigrated`.

- **eeadm recall**
  Use this command to recall the file data back from the tape and places the file in the premigrated state, or optionally in the resident state.

- **eeadm save**
  Use this command to save the name of empty files, empty directories, and symbolic links on the tape pools.

### 6.1.2 Using the command-line interface

The IBM Spectrum Archive EE system provides a command-line interface (CLI) that supports the automation of administrative tasks, such as starting and stopping the system, monitoring its status, and configuring tape cartridge pools. The CLI is the primary method for administrators to manage IBM Spectrum Archive EE. There is no GUI available as of this writing which allows administrators to perform operations, see “IBM Spectrum Archive EE dashboard” on page 35 for more info.

In addition, the CLI is used by the IBM Spectrum Scale `mmapplypolicy` command to trigger migrations or premigrations. When this action occurs, the `mmapplypolicy` command calls IBM Spectrum Archive EE when an IBM Spectrum Scale scan occurs, and passes the file name of the file that contains the scan results and the name of the target tape cartridge pool.
The `eeadm` command uses the following two syntax:

```
eeadm <resource_type> <action> [options], and eeadm <subcommand> [options]
```

**Reminder:** All of the command examples use the command without the full file path name because we added the IBM Spectrum Archive EE directory (`/opt/ibm/ltfsee/bin`) to the `PATH` variable.

For more information, see 10.1, “Command-line reference” on page 282.

### 6.2 Status information

This section describes the process that is used to determine whether each of the major components of IBM Spectrum Archive EE is running correctly. For more information about troubleshooting IBM Spectrum Archive EE, see Chapter 9, “Troubleshooting” on page 259.

The components should be checked in the order that is shown here because a stable, active GPFS file system is a prerequisite for starting IBM Spectrum Archive EE.

#### 6.2.1 IBM Spectrum Scale

The following IBM Spectrum Scale commands are used to obtain cluster state information:

- The `mmdiag` command obtains basic information about the state of the GPFS daemon.
- The `mmgetstate` command obtains the state of the GPFS daemon on one or more nodes.
- The `mmlscluster` and `mmlsconfig` commands show detailed information about the GPFS cluster configuration.

This section describes how to obtain GPFS daemon state information by running the GPFS command `mmgetstate`. For more information about the other GPFS commands, see the following publications:

- *IBM Spectrum Scale: Administration Guide*, which is available at IBM Knowledge Center.

The node on which the `mmgetstate` command is run must have the GPFS mounted. The node must also run remote shell commands on any other node in the GPFS/IBM Spectrum Scale cluster without the use of a password and without producing any extraneous messages.

Example 6-1 shows how to get status about the GPFS/IBM Spectrum Scale daemon on one or more nodes.

**Example 6-1 Check the GPFS/IBM Spectrum Scale status**

```bash
[root@ltfs97 ~]# mmgetstate -a
Node number Node name GPFS state
------------------------------------------
 1 htohru9   down
```

The `-a` argument shows the state of the GPFS/IBM Spectrum Scale daemon on all nodes in the cluster.
The following GPFS/IBM Spectrum Scale states are recognized and shown by this command:

- **Active**: GPFS/IBM Spectrum Scale is ready for operations.
- **Arbitrating**: A node is trying to form a quorum with the other available nodes.
- **Down**: GPFS/IBM Spectrum Scale daemon is not running on the node or is recovering from an internal error.
- **Unknown**: Unknown value. The node cannot be reached or some other error occurred.

If the GPFS/IBM Spectrum Scale state is not active, attempt to start GPFS/IBM Spectrum Scale and check its status, as shown in Example 6-2.

**Example 6-2  Start GPFS/IBM Spectrum Scale**

```
[root@ltfs97 ~]# mmstartup -a
Tue Apr  2 14:41:13 JST 2013: mmstartup: Starting GPFS ...
[root@ltfs97 ~]# mmgetstate -a
Node number  Node name        GPFS state
------------------------------------------
 1  htohru9          active
```

If the status is active, also check the GPFS/IBM Spectrum Scale mount status by running the command that is shown in Example 6-3.

**Example 6-3  Check the GPFS/IBM Spectrum Scale mount status**

```
[root@ltfs97 ~]# mmlsmount all
File system gpfs is mounted on 1 nodes.
```

The message confirms that the GPFS file system is mounted.

### 6.2.2 IBM Spectrum Archive Library Edition component

IBM Spectrum Archive EE constantly checks to see whether the IBM Spectrum Archive Library Edition (LE) component is running. If the IBM Spectrum Archive LE component is running correctly, you can see whether the LTFS file system is mounted by running the `mount` command or the `df` command, as shown in Example 6-4. The IBM Spectrum Archive LE component must be running on all EE nodes.

**Example 6-4  Check the IBM Spectrum Archive LE component status (running)**

```
[root@ltfs97 ~]# df -m
Filesystem  1M-blocks  Used  Available  Use% Mounted on
/dev/mapper/VolGroup-lv_root 33805  5081  27007  16% /
tmpfs  1963  0  1963  0% /dev/shm
/dev/vda1  485  36  424  8% /boot
/dev/gpfs 153600  8116  145484  6% /ibm/glues
ltfs:/dev/sg2 2147483648  0  2147483648  0% /ltfs
```

Permissions: Retrieving the status for GPFS/IBM Spectrum Scale requires root user permissions.
To start IBM Spectrum Archive LE run the `eadm cluster start` command. If errors occur during the start of the IBM Spectrum Archive EE system, run the `eadm node list` command to display which component failed to start. For more information about the updated `eadm node list` command, see 6.7, “IBM Spectrum Archive EE automatic node failover” on page 131.

### 6.2.3 Hierarchical Space Management

Hierarchical Space Management (HSM) must be running before you start IBM Spectrum Archive EE. You can verify that HSM is running by checking whether the watch daemon (`dsmwatchd`) and at least three recall daemons (`dsmrecalld`) are active. Query the operating system to verify that the daemons are active by running the command that is shown in Example 6-5.

**Example 6-5  Check the HSM status by running `ps`**

```
[root@ltfs97 ~]# ps -ef | grep dsm
root    1355     1  0 14:12 ?        00:00:01
        /opt/tivoli/tsm/client/hsm/bin/dsmwatchd nodeattach
root    5657     1  0 14:41 ?        00:00:00
        /opt/tivoli/tsm/client/hsm/bin/dsmrecall
root    5722  5657  0 14:41 ?        00:00:00
        /opt/tivoli/tsm/client/hsm/bin/dsmrecall
root    5723  5657  0 14:41 ?        00:00:00
        /opt/tivoli/tsm/client/hsm/bin/dsmrecall
```

The `dsmigfs` command also provides the status of HSM, as shown by the output in Example 6-6.

**Example 6-6  Check the HSM status by using `dsmigfs`**

```
[root@ltfs97 ~]# dsmigfs query -detail
IBM Tivoli Storage Manager
Command Line Space Management Client Interface
    Client Version 7, Release 1, Level 6.3
    Client date/time: 10/18/2016 23:17:15
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

The local node has Node ID: 1
The failover environment is active on the local node.
The recall distribution is enabled.

  File System Name: /ibm/gpfs
  High Threshold: 90
  Low Threshold: 80
  Premig Percentage: 10
  Quota: 227272
  Stub Size: 0
  Read Starts Recall: no
  Preview Size: 0
  Server Name: SERVER_A
  Max Candidates: 100
  Max Files: 0
  Read Event Timeout: 600
  Stream Seq: 0
```
Min Partial Rec Size: 0
Min Stream File Size: 0
MinMigFileSize: 0
Preferred Node: ltfs97.tuc.stglabs.ibm.com Node ID: 1
Owner Node: ltfs97.tuc.stglabs.ibm.com Node ID: 1

You can also ensure that the GPFS file system (named `gpfs` in this example) is managed by HSM by running the command that is shown in Example 6-7.

**Example 6-7  Check GPFS file system**

```
[root@ltfs97 /] mmlsfs gpfs|grep DMAPI
-z                 Yes                      Is DMAPI enabled?
```

To manage a file system with IBM Spectrum Archive EE, it must be data management application programming interface (DMAPI) enabled. A file system is managed by IBM Spectrum Archive EE by running the `ltfsee_config` command, which is described in 5.2, “Configuring IBM Spectrum Archive EE” on page 85.

**Permissions:** Starting HSM requires root user permissions.

If the HSM watch daemon (`dsmwatchd`) is not running, Example 6-8 shows you how to start it.

**Example 6-8  Start the HSM watch daemon**

```
[root@ltfsrl1 ~]# systemctl start hsm.service
[root@ltfsrl1 ~]# ps -afe | grep dsm
root    7687     1  0 08:46 ?        00:00:00
       /opt/tivoli/tsm/client/hsm/bin/dsmwatchd nodetach
root    8405  6621  0 08:46 pts/1    00:00:00 grep --color=auto
dsm
```

If the HSM recall daemons (`dsmrecalld`) are not running, Example 6-9 shows you how to start them.

**Example 6-9  Start HSM**

```
[root@ltfsml1 ~]# dsmmigfs start
IBM Tivoli Storage Manager Command Line Space Management Client Interface
   Client Version 7, Release 1, Level 4.80
   Client date/time: 02/11/2016 10:51:11
(c) Copyright by IBM Corporation and other(s) 1990, 2015. All Rights Reserved.
```

If failover operations within the IBM Spectrum Scale cluster are wanted on the node, run the `dsmmigfs enablefailover` command after you run the `dsmmigfs start` command.
6.2.4 IBM Spectrum Archive EE

After IBM Spectrum Archive EE is started, you can retrieve details about the node that the multi-tape management module (MMM) service was started on by running the `eeadm node list` command. You can also use this command to determine whether any component required for IBM Spectrum Archive EE failed to start. The MMM is the module that manages configuration data and physical resources of IBM Spectrum Archive EE.

**Permissions:** Retrieving the status for the MMM service does not require root user permissions.

If the MMM service is running correctly, you see a message similar to the message shown in Example 6-10.

**Example 6-10  Check the IBM Spectrum Archive EE status**

```
[root@ltfsml1 ~]# eeadm node list
Node ID  State      Node IP      Drives  Ctrl Node    Library  Node Group  Host Name
1        available  9.11.244.46       3  yes(active)  libb     G0  lib ltfsml1
```

If the MMM service is not running correctly, you may see a message that is similar to the message shown in Example 6-11.

**Example 6-11  Check the IBM Spectrum Archive EE status**

```
[root@ltfsml1 ~]# eeadm node list
Spectrum Archive EE service (MMM) for library libb fails to start or is not running on lib ltfsml1 Node ID:1
Problem Detected:
Node ID  Error Modules
1  LE; MMM;
```

In Example 6-11, IBM Spectrum Archive EE failed to start MMM because it was unable to mount LE. In this example, MMM failure to mount LE was caused by the server having no control path drives connected; therefore, the work around is to assign a control path drive to the server and have the monitor daemon automatically mount LE.

To monitor the process of IBM Spectrum Archive EEs start, run the `eeadm node list` command. If IBM Spectrum Archive EE is taking too long to recover, stop and start the process by using the `eeadm cluster stop/start` command. Example 6-12 shows the process of IBM Spectrum Archive EE recovering after a control path drive was connected.

**Example 6-12  Start IBM Spectrum Archive EE**

```
[root@ltfsml1 ~]# eeadm node list
Spectrum Archive EE service (MMM) for library libb fails to start or is not running on lib ltfsml1 Node ID:1
Problem Detected:
Node ID  Error Modules
1  LE; MMM;
```
1. LE(Starting); MMM;

[root@kyoto ~]# eeadm node list

<table>
<thead>
<tr>
<th>Node ID</th>
<th>State</th>
<th>Node IP</th>
<th>Drives</th>
<th>Ctrl Node</th>
<th>Library</th>
<th>Node Group</th>
<th>Host Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>available</td>
<td>9.11.244.46</td>
<td>3</td>
<td>yes(active)</td>
<td>libb</td>
<td>G0</td>
<td>lib_ltfsml1</td>
</tr>
</tbody>
</table>

**Important:** If the `eeadm cluster start` command does not return after several minutes, it might be because the firewall is running or tapes are being unmounted from the drives. The firewall service must be disabled on the IBM Spectrum Archive EE nodes. For more information, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

### 6.3 Upgrading components

The following sections describe the process that is used to upgrade IBM Spectrum Scale and other components of IBM Spectrum Archive EE.

#### 6.3.1 IBM Spectrum Scale

Complete this task if you must update your version of IBM Spectrum Scale that is used with IBM Spectrum Archive EE.

Before any system upgrades or major configuration changes are made to your IBM Spectrum Scale cluster, review your IBM Spectrum Scale documentation and consult the IBM Spectrum Scale frequently asked question (FAQ) information that applies to your version of IBM Spectrum Scale.

For more information about the IBM Spectrum Scale FAQ, see IBM Knowledge Center and select the IBM Spectrum Scale release under the Cluster product libraries topic in the navigation pane that applies to your installation.

To update IBM Spectrum Scale, complete the following steps:

1. Stop IBM Spectrum Archive EE by running the command that is shown in Example 6-13.

   **Example 6-13  Stop IBM Spectrum Archive EE**

   

   ```
   [root@ltfsml1 ~]# eeadm cluster stop
   
   Library name: libb, library serial: 000001340190402, control node (ltfsee_md)
   IP address: 9.11.244.46.
   Stopping - sending request and waiting for the completion.
   ..
   Stopped the IBM Spectrum Archive EE services for library libb.
   ```

2. Run the `pidof mmm` command on all EE Control Nodes until all MMM processes have been terminated.

3. Run the `pidof ltfs` command on all EE nodes until all ltfs processes are stopped.
4. Disable DSM failover by running the command that is shown in Example 6-14.

   **Example 6-14  Disable failover**
   
   ```bash
   [root@ltfsml1 ~]# dsmmigfs disablefailover
   IBM Spectrum Protect
   Command Line Space Management Client Interface
   Client Version 8, Release 1, Level 0.0
   Client date/time: 04/20/2017 11:31:18
   (c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.
   
   Automatic failover is disabled on this node.
   ```

5. Stop the Tivoli Storage Manager for Space Management HSM by running the command that is shown in Example 6-15.

   **Example 6-15  Stop HSM**
   
   ```bash
   [root@ltfsml1 ~]# dsmmigfs stop
   IBM Tivoli Storage Manager
   Command Line Space Management Client Interface
   Client Version 7, Release 1, Level 4.80
   Client date/time: 02/11/2016 10:57:52
   (c) Copyright by IBM Corporation and other(s) 1990, 2015. All Rights Reserved.
   
   This command must be run on every IBM Spectrum Archive EE node.
   ```

6. Stop the watch daemon by running the command that is shown in Example 6-16.

   **Example 6-16  Stop the watch daemon**
   
   ```bash
   [root@ltfsml1 ~]# systemctl stop hsm.service
   
   This command must be run on every IBM Spectrum Archive EE node.
   ```

7. Unmount GPFS by running the command that is shown in Example 6-17.

   **Example 6-17  Stop GPFS**
   
   ```bash
   [root@ltfs97 ~]# mmumount all
   Tue Apr 16 23:43:29 JST 2013: mmumount: Unmounting file systems ...
   ```

   If the `mmumount all` command results show that processes are still being used (as shown in Example 6-18), you must wait for them to finish and then run the `mmumount all` command again.

   **Example 6-18  Processes running that prevent the unmounting of the GPFS file system**
   
   ```bash
   [root@ltfs97 ~]# mmumount all
   Tue Apr 16 23:46:12 JST 2013: mmumount: Unmounting file systems ...
   umount: /ibm/glues: device is busy.
   (In some cases useful info about processes that use the device is found by lsof(8) or fuser(1))
   umount: /ibm/glues: device is busy.
   (In some cases useful info about processes that use the device is found by lsof(8) or fuser(1))
   ```
8. Shut down GPFS by running the command that is shown in Example 6-19.

   **Example 6-19  Shut down GPFS**

   [root@ltfs97 ~]# mmshutdown -a
   Tue Apr 16 23:46:51 JST 2013: mmshutdown: Starting force unmount of GPFS file systems
   Tue Apr 16 23:46:56 JST 2013: mmshutdown: Shutting down GPFS daemons
   htohr9.ltd.sdl:  Shutting down!
   htohr9.ltd.sdl:  'shutdown' command about to kill process 3645
   htohr9.ltd.sdl:  Unloading modules from /lib/modules/2.6.32-220.el6.x86_64/extra
   htohr9.ltd.sdl:  Unloading module mmfs26
   htohr9.ltd.sdl:  Unloading module mmfslinux
   htohr9.ltd.sdl:  Unloading module tracedev
   Tue Apr 16 23:47:03 JST 2013: mmshutdown: Finished

9. Download the IBM Spectrum Scale update from IBM Fix Central. Extract the IBM Spectrum Scale .rpm files and install the updated .rpm files by running the command that is shown in Example 6-20.

   **Example 6-20  Update IBM Spectrum Scale**

   rpm -Uvh *.rpm

10. Rebuild and install the IBM Spectrum Scale portability layer by running the command that is shown in Example 6-21.

   **Example 6-21  Rebuild GPFS**

   mmbuildgpl

11. Start GPFS by running the command that is shown in Example 6-22.

   **Example 6-22  Start GPFS**

   [root@ltfs97 ~]# mmstartup -a
   Tue Apr 16 23:47:42 JST 2013: mmstartup: Starting GPFS ...

12. Mount the GPFS file system by running the command that is shown in Example 6-23.

   **Example 6-23  Mount GPFS file systems**

   [root@ltfs97 ~]# mmmount all
   Tue Apr 16 23:48:09 JST 2013: mmmount: Mounting file systems ...

13. Start the watch daemon by running the command that is shown in Example 6-24.

   **Example 6-24  Start the watch daemon**

   [root@ltfsml1 ~]# systemctl start hsm.service

   This command must be run on every IBM Spectrum Archive EE node.

14. Start the HSM by running the command that is shown in Example 6-25.

   **Example 6-25  Start HSM**

   [root@ltfsml1 ~]# dsmmigfs start

IBM Tivoli Storage Manager
Command Line Space Management Client Interface
15. Enable failover by running the command that is shown in Example 6-26.

Example 6-26   Enable failover

[root@ltfsml1 ~]# dsmmigfs enablefailover
IBM Spectrum Protect
Command Line Space Management Client Interface
Client Version 8, Release 1, Level 0.0
Client date/time: 04/20/2017 14:51:05
(c) Copyright by IBM Corporation and other(s) 1990, 2016. All Rights Reserved.

Automatic failover is enabled on this node in mode ENABLED.

16. Start IBM Spectrum Archive EE by running the command that is shown in Example 6-27.

Example 6-27   Start IBM Spectrum Archive EE

[root@ltfsml1 ~]# eeadm cluster start
Library name: libb, library serial: 0000013400190402, control node (ltfsee_md)
IP address: 9.11.244.46.
Starting - sending a startup request to libb.
Starting - waiting for startup completion : libb.
Starting - opening a communication channel : libb.
.
Starting - waiting for getting ready to operate : libb.
..................
Started the IBM Spectrum Archive EE services for library libb with good status.

Optionally, you can check the status of each component when it is started, as described in 6.2, “Status information” on page 116.

6.3.2 IBM Spectrum Archive LE component

For more information about how to upgrade the IBM Spectrum Archive LE component, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58. Because the IBM Spectrum Archive LE component is a component of IBM Spectrum Archive EE, it is upgraded as part of the IBM Spectrum Archive EE upgrade.

6.3.3 Hierarchical Storage Management

For more information about how to upgrade HSM, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58. Because HSM is a component of IBM Spectrum Archive EE, it is upgraded as part of the IBM Spectrum Archive EE upgrade.
6.3.4 IBM Spectrum Archive EE

For more information about how to upgrade IBM Spectrum Archive EE, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

6.4 Starting and stopping IBM Spectrum Archive EE

This section describes how to start and stop IBM Spectrum Archive EE.

6.4.1 Starting IBM Spectrum Archive EE

Run the `eeadm cluster start` command to start the IBM Spectrum Archive EE system. The HSM components must be running before you can use this command. You can run the `eeadm cluster start` command on any IBM Spectrum Archive EE node in the cluster.

For example, to start IBM Spectrum Archive EE, run the command that is shown in Example 6-28.

```
Example 6-28   Start IBM Spectrum Archive EE

[root@ltfsml1 ~]#  eeadm cluster start
Library name: libb, library serial: 0000013400190402, control node (ltfsee_md) IP address: 9.11.244.46.
Starting - sending a startup request to libb.
Starting - waiting for startup completion : libb.
Starting - opening a communication channel : libb.
Starting - waiting for getting ready to operate : libb.
......................
Started the IBM Spectrum Archive EE services for library libb with good status.
```

**Important:** If the `eeadm cluster start` command does not return after several minutes, it might be because the firewall is running or unmounting tapes from drives. The firewall service must be disabled on the IBM Spectrum Archive EE nodes. For more information, see 4.3.2, “Installing, upgrading, or uninstalling IBM Spectrum Archive EE” on page 58.

You can confirm that IBM Spectrum Archive EE is running by referring to the steps in Example 6-10 on page 120 or by running the command in Example 6-29.

```
Example 6-29   Check the status of all available IBM Spectrum Archive EE nodes

[root@ltfsml1 ~]#  eeadm node list
Node ID  State      Node IP      Drives  Ctrl Node    Library  Node Group  Host
Name     
1        available  9.11.244.46       3  yes(active)  libb     G0  lib_ltfsml1
```

Chapter 6. Operations   125
6.4.2 Stopping IBM Spectrum Archive EE

The `eeadm cluster stop` command stops the IBM Spectrum Archive EE system on all EE Control Nodes.

For example, to start IBM Spectrum Archive EE, run the command that is shown in Example 6-30.

**Example 6-30  Stop IBM Spectrum Archive EE**

```
[root@ltfsml1 ~]# eeadm cluster stop
Library name: libb, library serial: 000013400190402, control node (ltfsee_md) IP address: 9.11.244.46.
Stopping - sending request and waiting for the completion.
.
Stopped the IBM Spectrum Archive EE services for library libb.
```

In some cases, you might see the GLESM658I informational message if there are active tasks on the task queue in IBM Spectrum Archive EE:

There are still tasks in progress.

To terminate IBM Spectrum Archive EE for this library, run the "eeadm cluster stop" command with the "-f" or "--force" option.

If you are sure that you want to stop IBM Spectrum Archive EE, run the `eeadm cluster stop` command with the `-f` option, which forcefully stops any running IBM Spectrum Archive EE tasks abruptly.

6.5 Task command summaries

For any IBM Spectrum Archive EE commands that generates a task, the `eeadm task list` and `eeadm task show` commands will be used to display the task information. For the list of task generating commands, refer to “User Task Reporting” on page 7. The `eeadm task list` and `eeadm task show` commands has replaced the `ltfsee info scans` and `ltfsee info jobs` commands.

6.5.1 eeadm task list

The most common use will be to get the list of active tasks which will either be in the running, waiting, or interrupted status. The output will be sorted by status in the following order:

1. Running
2. Waiting or interrupted

Within each status group, the entries will be sorted by Priority (H, M, L order).

- H will be any transparent or selective recall commands
- M will be any premigration, migration, or save commands
- L will be everything else (general commands)

Within Running status, within the same Priority, the entries will be sorted by Started Time (oldest at the top).
Example 6-31 shows active tasks.

Example 6-31  Viewing active tasks

```
[root@kyoto ~]# eeadm task list
TaskID  Type              Priority  Status   #DRV  CreatedTime(-0700)  StartedTime(-0700)
18822  selective_recall  H         running  1     2019-01-07_11:43:04
2019-01-07_11:43:04
18823  selective_recall  H         waiting  0     2019-01-07_11:43:09
2019-01-07_11:43:09
18824  migrate           M         waiting  0     2019-01-07_11:43:11
2019-01-07_11:43:11
```

The other common use will be to get the list of completed tasks which returns the prior task IDs, result, and date/time information, sorted by completed time (oldest at the top). For administrators, this allows a quick view into task IDs, the history of what task has been executed recently and their results. For more information about the specified task, see “eeadm task show” on page 127.

Example 6-32 shows five completed tasks.

Example 6-32  View previous 5 completed tasks

```
[root@kyoto ~]# eeadm task list -c -n 5
TaskID  Type              Result     CompletedTime(-0700)  StartedTime(-0700)
```

For more information about the task status, see “User Task Reporting” on page 7.

### 6.5.2 eeadm task show

The most common use will be to get the detailed information of the specified task, including a verbose option which shows the output messages and subtask information. For any failed tasks, the administrator can preform resubmission of those tasks or next step recovery procedures. Example 6-33 shows the output verbosely from an active migration task.

Example 6-33  Verbose output of an active migration task

```
[root@kyoto ~]# eeadm task show 18830 -v
=== Task Information ===
Task ID:              18830
Task Type:            migrate
Command Parameters:   eeadm migrate mig3 -p pool1
Status:               running
Result:               -
```
Example 6-34 shows the output verbosely of a completed migration task.

Example 6-34   Verbose output of a completed migration task

[root@kyoto ~]# eeadm task show 18830 -v

--- Task Information ---
Task ID: 18830
Task Type: migrate
Command Parameters: eeadm migrate mig3 -p pool1
Status: completed
Result: succeeded
Accepted Time: Mon Jan 7 11:58:34 2019 (-0700)
Started Time: Mon Jan 7 11:58:34 2019 (-0700)
Completed Time: Mon Jan 7 11:59:34 2019 (-0700)
Workload: 100 files. 1 replicas.
7545870371 bytes to copy. 1 copy tasklets on pool1@libb.
Progress: 1/1 copy tasklets completed on pool1@libb.
Result Summary: 100 succeeded, 0 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small, 0 too early.

(GLESMB991) All files have been successfully copied on pool1/libb.

2019-01-07 11:59:30.556694 GLESMB134I: Copy result: 100 succeeded, 0 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.
2019-01-07 11:59:30.556838 GLESMB991: All files have been successfully copied on pool1/libb.

The other common use will be to show the file results of each individual file from any premigration, migration or recall tasks. With this information, the administrator can determine which files were successful and which files failed including the error code (reason) and date/time the error occurred. The administrator can quickly determine which files failed, and take corrective actions including resubmission for those failed files. Example 6-35 shows the completed task results.

Example 6-35 Completed task results
[root@kyoto prod]# eeadm task show 18835 -r

For more information about the task status, see “User Task Reporting” on page 7.

### 6.6 IBM Spectrum Archive EE database backup

IBM Spectrum Archive EE uses databases to store important system states and configurations for healthy operations. Starting with IBM Spectrum Archive EE v1.2.4.0, database backup is performed automatically and stores as many as three backups. The backup files can be found under the `/var/opt/ibm/ltfsee/local/dbbackup` directory.

Database backup is performed automatically whenever a significant modification is performed to the cluster that requires updating the original database. These changes include the following commands:

- `eeadm pool create`
- `eeadm pool delete`
- `eeadm tape assign`
- `eeadm tape unassign`
- `eeadm drive assign`
- `eeadm drive unassign`
- `ltfsee_config -m ADD_CTRL_NODE`
- `ltfsee_config -m ADD_NODE`
- `ltfsee_config -m REMOVE_NODE`
The backups are performed when IBM Spectrum Archive EE is running, part of the monitor daemon checks periodically if the original database files have been modified by the above operations. If the thread detects that there has been a modification, then it will go into a grace period. If no further modifications are performed during a set amount of time during this grace period, a backup will then occur.

This technique is intended to prevent repeating backups in a short amount of time, for example when multiple tapes are being added to a pool when users perform `eadm tape assign` on multiple tapes. Instead, it performs a backup after the command finished executing and no further changes are made in a set time limit.

These backups are crucial in rebuilding an IBM Spectrum Archive EE cluster if a server gets corrupted or the GPFS file system needs to be rebuilt. After reinstalling the IBM Spectrum Archive EE onto the server, replace the `.global` and `.lib` database files under the `path/to/gpfs/filesystem/.ltfsee/config` directory with the database files backed up from the `/var/opt/ibm/ltfsee/local/dbbackup/` directory.

### 6.7 IBM Spectrum Archive EE automatic node failover

This section describes IBM Spectrum Archive EE automatic failover features, and the new LTFSEE monitoring daemon and the updated commands to display any nodes that are having issues.

#### 6.7.1 IBM Spectrum Archive EE monitoring daemon

When IBM Spectrum Archive EE is started, a monitoring daemon is started on each node to monitor various critical components that make up the software:

- MMM
- IBM Spectrum Archive LE
- Remote IBM Spectrum Archive EE monitoring daemon(s)
- IBM Spectrum Scale (GPFS) daemon called `mmfsd`
- IBM Spectrum Protect for Space Management (HSM) recall daemon called `dsmreca11d`
- Rpcbind
- Rsyslog
- SSH

Components, such as MMM, IBM Spectrum Archive LE, and remote monitoring daemons, have automatic recovery features. If one of those three components is hung, or has crashed, the monitor daemon performs a recovery to restart it. In an environment where a redundant control node is available and MMM is no longer responding or alive, an attempt to restart the MMM service on the current node is made and if it fails a failover takes place and the redundant control node becomes the new active control node.

If there is only one control node available in the cluster, then an in-place failover occurs to bring back the MMM process on that control node.
As for the rest of the components, currently there are no automatic recovery actions that can be performed. If GPFS, HSM, rpcbind, or rsyslog are having problems, the issues can be viewed by using the `eeadm node list` command.

Example 6-36 shows output from running `eeadm node list` when one node has not started `rpcbind`. To correct this error, start `rpcbind` on the designated node and EE will refresh itself and the node will become available.

```
Example 6-36   The eeadm info nodes output
[root@daito ~]# eeadm node list
Spectrum Archive EE service (MMM) for library libb fails to start or is not running on daito Node ID:1
Problem Detected:
Node ID  Error Modules
1  MMM; rpcbind;
```

In addition to the automatic failover, there is also an option to perform a manual failover by running the `eeadm cluster failover` command. This command is used to fail over the MMM process to a redundant control node. This command is only available for use when a redundant control node exists. Example 6-37 shows output from running the `eeadm cluster failover` command.

```
Example 6-37   The eeadm failover command
[root@kyoto ~]# eeadm cluster failover
Use the "eeadm node list" command to see if the control node is switched over.
```

### 6.8 Tape library management

This section describes how to use `eeadm` commands to add and remove tape drives and tape cartridges from your LTFS library.

#### 6.8.1 Adding tape cartridges

This section describes how to add tape cartridges in IBM Spectrum Archive EE. An unformatted tape cartridge cannot be added to the IBM Spectrum Archive EE library.
However, you can format a tape when you add it to a tape cartridge pool. The process of formatting a tape in LTFS creates the required LTFS partitions on the tape.

After tape cartridges are added through the I/O station, or after they are inserted directly into the tape library, you might have to run an `eeadm library rescan` command. First, run the `eeadm tape list` command. If the tape cartridges are missing, run the `eeadm library rescan` command, which synchronizes the data for these changes between the IBM Spectrum Archive EE system and the tape library.

This process occurs automatically. However, if the tape does not appear within the `eeadm tape list` command output, you can force a rebuild of the inventory (synchronization of IBM Spectrum Archive EE inventory with the tape library’s inventory).

Data tape cartridge

To add a tape cartridge (that was previously used by LTFS) to the IBM Spectrum Archive EE system, complete the following steps:

1. Insert the tape cartridge into the I/O station.
2. Run the `eeadm tape list` command to see whether your tape appears in the list, as shown in Example 6-38. In this example, the `-l` option is used to limit the tapes to one tape library.

```
Example 6-38 Run the eeadm tape list command to check whether a tape cartridge must be synchronized

[root@mikasa1 ~]# eeadm tape list -l lib_saitama
Tape ID   Status  State       Usable(GiB)  Used(GiB)  Available(GiB)  Reclaimable%  Pool   Library      Location  Task ID
JCA224JC  ok      appendable         6292          0            6292            0%  pool1  lib_saitama  homeslot  -
JCC093JC  ok      appendable         6292        496            5796            0%  pool1  lib_saitama  homeslot  -
JCB745JC  ok      appendable         6292          0            6292            0%  pool2  lib_saitama  homeslot  -
```

Tape cartridge JCA561JC is not in the list.

3. Because tape cartridge JCA561JC is not in the list, synchronize the data in the IBM Spectrum Archive EE inventory with the tape library by running the `eeadm library rescan` command, as shown in Example 6-39.

```
Example 6-39 Synchronize the tape

[[root@mikasa1 ~] # eeadm library rescan
(id=ebc1b34a-1bd8-4c86-b4fb-bee7b60c24c7, ip_addr=9.11.244.44)
(id=8a59cc8b-bd15-4910-88ae-68306006c6da, ip_addr=9.11.244.42)
```

4. Repeating the `eeadm tape list` command shows that the inventory was corrected, as shown in Example 6-40.

```
Example 6-40 Tape cartridge JCA561JC is synchronized

[root@mikasa1 ~]# eeadm tape list -l lib_saitama
Tape ID   Status  State       Usable(GiB)  Used(GiB)  Available(GiB)  Reclaimable%  Pool   Library      Location  Task ID
JCA224JC  ok      appendable         6292          0            6292            0%  pool1  lib_saitama  homeslot  -
JCC093JC  ok      appendable         6292        496            5796            0%  pool1  lib_saitama  homeslot  -
JCB745JC  ok      appendable         6292          0            6292            0%  pool2  lib_saitama  homeslot  -
JCA561JC  ok      unassigned            0          0               0            0%  -      lib_saitama  ieslot    -
```
5. If necessary, move the tape cartridge from the I/O station to a storage slot by running the `eeadm tape move` command (see Example 6-41) with the `-L homeslot` option. The example also requires a `-1` option because of multiple tape libraries.

```
Example 6-41  Move tape to homeslot
[root@mikasa1 ~]# eeadm tape move JCA561JC -L homeslot -l lib_saitama
2019-01-07 14:02:36 GLESL700I: Task tape_move was created successfully, task id is 6967.
2019-01-07 14:02:50 GLESL103I: Tape JCA561JC is moved successfully.
```

6. Add the tape cartridge to a tape cartridge pool. If the tape cartridge contains actual data to be added to LTFS, you must import it first before you add it. Run the `eeadm tape import` command to add the tape cartridge into the IBM Spectrum Archive EE library and import the files on that tape cartridge into the IBM Spectrum Scale namespace as stub files.

If you have no data on the tape cartridge (but it is already formatted for LTFS), add it to a tape cartridge pool by running the `eeadm tape assign` command.

**Scratch cartridge**

To add a scratch cartridge to the IBM Spectrum Archive EE system, complete the following steps:

1. Insert the tape cartridge into the I/O station.
2. Synchronize the data in the IBM Spectrum Archive EE inventory with the tape library by running the `eeadm library rescan` command, as shown in Example 6-39 on page 133.
3. If necessary, move the tape cartridge from the I/O station to a storage slot by running the `eeadm tape move` command with the `-L homeslot` option, as shown in Example 6-41 on page 134.
4. The `eeadm tape assign` command automatically formats tapes when assigning them to a pool. Use the `-f` or `--format` option only when the user is aware that the tape(s) still contain files and are no longer needed. For example, Example 6-42 shows the output of the `eeadm tape assign` command.

```
Example 6-42  Format a scratch tape
[root@mikasa1 ~]# eeadm tape assign JCA561JC -p pool1 -l lib_saitama
2019-01-07 14:06:23 GLESL700I: Task tape_assign was created successfully, task id is 6968.
```

For more information about other formatting options, see 6.8.3, “Formatting tape cartridges” on page 136.
6.8.2 Moving tape cartridges

This section summarizes the IBM Spectrum Archive EE commands that can be used for moving tape cartridges.

Moving to different tape cartridge pools

If a tape cartridge contains any files, IBM Spectrum Archive EE will not allow you to move a tape cartridge from one tape cartridge pool to another. If this move is attempted, you receive an error message, as shown in Example 6-43.

Example 6-43   Error message when removing a tape cartridge from a pool with migrated/saved files

```
[root@mikasa1 ~]# eeadm tape unassign JCC093JC -p pool1 -l lib_saitama
2019-01-07 15:10:36 GLESL700I: Task tape_unassign was created successfully, task id is 6970.
2019-01-07 15:10:36 GLESL357E: Tape JCC093JC has migrated files or saved files. It has not been unassigned from the pool.
```

However, you can remove an empty tape cartridge from one tape cartridge pool and add it to another tape cartridge pool, as shown in Example 6-44.

Example 6-44   Remove an empty tape cartridge from one tape cartridge pool and add it to another

```
[root@mikasa1 ~]# eeadm tape unassign JCA561JC -p pool1 -l lib_saitama
2019-01-07 15:11:26 GLESL700I: Task tape_unassign was created successfully, task id is 6972.
[root@mikasa1 ~]# eeadm tape assign JCA561JC -p pool2 -l lib_saitama
2019-01-07 15:12:10 GLESL700I: Task tape_assign was created successfully, task id is 6974.
```

Before you remove a tape cartridge from one tape cartridge pool and add it to another tape cartridge pool, reclaim the tape cartridge to ensure that no files remain on the tape when it is removed. For more information, see 6.17, “Reclamation” on page 174.

Moving to the homeslot

To move a tape cartridge from a tape drive to its homeslot in the tape library, use the command that is shown in Example 6-45. You might want to use this command in cases where a tape cartridge is loaded in a tape drive and you want to unload it.

Example 6-45   Move a tape cartridge from a tape drive to its homeslot

```
[root@kyoto prod]# eeadm tape move D00369L5 -p pool1 -L homeslot
2019-01-07 15:47:26 GLESL700I: Task tape_move was created successfully, task id is 18843.
2019-01-07 15:49:14 GLESL103I: Tape D00369L5 is moved successfully.
```
### Moving to the I/O station

The command that is shown in Example 6-46 moves a tape cartridge to the ieslot (I/O station). This might be required when tape cartridges are exported or offline.

**Example 6-46** Move a tape cartridge to the ieslot after an offline operation

```bash
[root@mikasa1 ~]# eeadm tape offline JCA561JC -p pool2 -l lib_saitama
2019-01-07 15:50:17 GLESL700I: Task tape_offline was created successfully, task id is 6976.
2019-01-07 15:50:17 GLESL073I: Offline export of tape JCA561JC has been requested.

[root@mikasa1 ~]# eeadm tape move JCA561JC -p pool2 -l lib_saitama -L ieslot
2019-01-07 15:53:45 GLESL700I: Task tape_move was created successfully, task id is 6978.
2019-01-07 15:53:45 GLESL103I: Tape JCA561JC is moved successfully.
```

The move can be between homeslot and ieslot or tape drive and homeslot. If the tape cartridge belongs to a tape cartridge pool and online (not in the Offline state), the request to move it to the ieslot fails. After a tape cartridge is moved to ieslot, the tape cartridge cannot be accessed from IBM Spectrum Archive EE. If the tape cartridge contains migrated files, the tape cartridge should not be moved to ieslot without first exporting or offlineing the tape cartridge.

A tape cartridge in ieslot cannot be added to a tape cartridge pool. Such a tape cartridge must be moved to home slot before adding it.

### 6.8.3 Formatting tape cartridges

This section describes how to format a medium in the library for the IBM Spectrum Archive EE. To format a scratch tape use the `eeadm tape assign` command, and only use the `-f/--format` option when the user no longer requires access to the data on the tape.

If the tape cartridge is already formatted for IBM Spectrum Archive EE and contains file objects, the format fails, as shown in Example 6-47.

**Example 6-47** Format failure

```bash
[root@kyoto prod]# eeadm tape assign 1FB922L5 -p pool2
2019-01-08 08:29:08 GLESL700I: Task tape_assign was created successfully, task id is 18850.
2019-01-08 08:30:21 GLESL138E: Failed to format the tape 1FB922L5, because it is not empty.
```

When the formatting is requested, IBM Spectrum Archive EE attempts to mount the target medium to obtain the medium condition. The medium is formatted if the `mount` command finds any of the following conditions:

- The medium was not yet formatted for LTFS.
- The medium was previously formatted for LTFS and has no data written.
- The medium has an invalid label.
- Labels in both partitions do not have the same value.
If none of these conditions are found, the format fails. If the format fails because files exist on
the tape, the user should add the tape to their designated pool by using the `eeadm tape
import` command. If the user no longer requires what is on the tape, the `-f/--format` option
can be added to the `eeadm tape assign` command to force a format.

Example 6-48 shows a tape cartridge being formatted by using the `-f` option.

```
Example 6-48   Forced format

[root@kyoto prod]# eeadm tape assign 1FB922L5 -p pool2 -f
2019-01-08 08:32:42 GLESL700I: Task tape_assign was created successfully, task id
is 18852.
2019-01-08 08:35:08 GLESL087I: Tape 1FB922L5 successfully formatted.
2019-01-08 08:35:08 GLESL360I: Assigned tape 1FB922L5 to pool pool2 successfully.
```

Multiple tape cartridges can be formatted by specifying multiple tape VOLSERs. Example 6-49 shows three tape cartridges that are formatted sequentially or simultaneously.

```
Example 6-49   Format multiple tape cartridges

[root@mikasa1 ~]# eeadm tape assign JCC075JC JCB610JC JCC130JC -p pool1 -l
lib_saitama
2019-01-08 09:25:32 GLESL700I: Task tape_assign was created successfully, task id
is 6985.
2019-01-08 09:30:26 GLESL087I: Tape JCB610JC successfully formatted.
2019-01-08 09:30:26 GLESL360I: Assigned tape JCB610JC to pool pool1 successfully.
2019-01-08 09:30:33 GLESL087I: Tape JCC130JC successfully formatted.
2019-01-08 09:30:33 GLESL360I: Assigned tape JCC130JC to pool pool1 successfully.
2019-01-08 09:30:52 GLESL087I: Tape JCC075JC successfully formatted.
2019-01-08 09:30:52 GLESL360I: Assigned tape JCC075JC to pool pool1 successfully.
```

When multiple format tasks are submitted, IBM Spectrum Archive EE uses all available drives
with the ‘g’ drive attribute for the format tasks, which are done in parallel.

**Active file check before formatting tape cartridges**

Some customers (such as those in the video surveillance industry) might want to retain data
only for a certain retention period and then reuse the tape cartridges. Running the
reconciliation and reclamation commands are the most straightforward method. However,
this process might take a long time if there are billions of small files in GPFS, because the
command checks every file in GPFS and deletes files on the tape cartridge one by one.

The fastest method is to manage the pool and identify data in tape cartridges that has passed
the retention period. Customers can then remove the tape cartridge and add to a new pool by
reformatting the entire tape cartridge. This approach saves time, but customers need to be
certain that the tape cartridge does not have any active data.

To be sure that a tape cartridge is format-ready, this section uses the `-E` option, to the `eeadm
tape unassign` command. When ran, this command checks whether the tape cartridge
contains any active data. If all the files in the tape cartridge have already been deleted in
GPFS, the command determines that the tape cartridge is effectively empty and removes the
tape cartridge from the pool. If the tape cartridge still has active data, the command will not
remove it. No reconciliation command is necessary before this command.
When -E is ran, the command performs the following steps:

1. Determine whether the specified tape cartridge is in the specified pool and is not mounted.
2. Reserve the tape cartridge so that no migration will occur to the tape.
3. Read the volume cache (GPFS file) for the tape cartridge. If any file entries exist in the volume cache, check whether the corresponding GPFS stub file exists, as-is or renamed.
4. If the tape cartridge is empty or has files but all of them have already been deleted in GPFS (not renamed), remove the tape cartridge from the pool.

Example 6-50 shows the output of the `eeadm tape unassign -E` command with a tape which contains files but all files on the gpfs file system deleted.

Example 6-50 Removing tape cartridge from pool with active file check

```
[root@mikasa1 prod]# eeadm tape unassign JCB350JC -p test2 -l lib_saitama -E
2019-01-08 10:20:07 GLESL700I: Task tape_unassign was created successfully, task id is 7002.
2019-01-08 10:20:09 GLESL572I: Unassign tape JCB350JC from pool test2 successfully. Format the tape when assigning it back to a pool.
```

5. If the tape cartridge has a valid, active file, the check routine aborts on the first hit and goes on to the next specified tape cartridge. The command will not remove the tape cartridge from the pool.

In Example 6-51, shows the output of the `eeadm tape unassign -E` command with a tape which contains active files.

Example 6-51 Tape cartridges containing inactive data are removed from the pool

```
[root@mikasa1 prod]# eeadm tape unassign JCB350JC -p test2 -l lib_saitama -E
2019-01-08 10:17:15 GLESL700I: Task tape_unassign was created successfully, task id is 6998.
2019-01-08 10:17:16 GLESL357E: Tape JCB350JC has migrated files or saved files. It has not been unassigned from the pool.
```

The active file check applies to all data types that the current IBM Spectrum Archive EE might store to a tape cartridge:

- Normal migrated files
- Saved objects such as empty directory and link files

Another approach is to run `mmapplypolicy` to list all files that have been migrated to the designated tape cartridge ID. However, if the IBM Spectrum Scale file system has over 1 billion files, the `mmapplypolicy` scan might take a long time.

### 6.8.4 Removing tape drives

When the LTFS mounts the library, all tape drives are inventoried by default. The following procedure can be started when a tape drive requires replacing or repairing and must be physically removed from the library. The same process also must be carried out when firmware for the tape drive is upgraded. If a tape is in the drive and a task is in-progress, the tape is unloaded automatically when the task completes.

After mounting the library, the user can run `eeadm` commands to manage the library and to correct a problem if one occurs.
To remove a tape drive from the library, complete the following steps:

1. Remove the tape drive from the IBM Spectrum Archive EE inventory by running the `eeadm drive unassign` command, as shown in Example 6-52. A medium in the tape drive is automatically moved to the home slot (if one exists).

   **Example 6-52  Remove a tape drive**

   ```
   [root@mikasa1 prod]# eeadm drive list -l lib_saitama
   Drive S/N     State        Type    Role  Library      Node ID  Tape      Node Group  Task ID
   0000078PG24E  not_mounted  TS1160   mrg  lib_saitama  6        -     G0          -
   0000078PG20E  mounted      TS1160   mrg  lib_saitama  2        JCB350JC G0         -
   0000078D9DBA  not_mounted  TS1155   mrg  lib_saitama  2        -     G0          -
   0000078PG24A  not_mounted  TS1160   mrg  lib_saitama  6        -     G0          -
   00000000A246  unassigned   -        ---  lib_saitama  -        -     -           -

   ```

2. Physically remove the tape drive from the tape library.

For more information about how to remove tape drives, see the IBM Knowledge Center for your IBM tape library.

### 6.8.5  Adding tape drives

Add the tape drive to the LTFS inventory by running the `eeadm drive assign` command, as shown in Example 6-53.

Optionally, drive attributes can be set when adding a tape drive. Drive attributes are the logical OR of the attributes: `migrate(4)`, `recall(2)`, and `generic(1)`. If the individual attribute is set, any corresponding tasks on the task queue can be run on that drive. The drive attributes can be specified using the `-r` option and must be a decimal number.

In Example 6-53, `6` is the logical OR of `migrate(4)` and `recall(2)`, so migration tasks and recall tasks can be performed on this drive. For more information, see 6.20, “Drive Role settings for task assignment control” on page 181.

The node ID is required for the `eeadm drive assign` command.

**Example 6-53  Add a tape drive**

```
[root@mikasa1 prod]# eeadm drive assign 0000078PG20E -r 6 -n 2 -l lib_saitama
[root@mikasa1 prod]# eeadm drive list -l lib_saitama
```
### 6.9 Tape storage pool management

This section describes how to use the `eeadm pool` command to manage tape cartridge pools with IBM Spectrum Archive EE.

**Permissions:** Managing tape cartridge pools by running the `eeadm pool` command requires root user permissions.

To perform file migrations, it is first necessary to create and define tape cartridge pools, which are the targets for migration. It is then possible to add or remove tape cartridges to or from the tape cartridge pools.

Consider the following rules and recommendations for tape cartridge pools:

- Before adding tape cartridges to a tape cartridge pool, the tape cartridge must first be in the homeslot of the tape library. For more information about moving to the homeslot, see 6.8.2, “Moving tape cartridges” on page 135.

- Multiple tasks can be performed in parallel when more than one tape cartridge is defined in a tape cartridge pool. Have multiple tape cartridges in each tape cartridge pool to increase performance.

- The maximum number of drives in a node group that is used for migration for a particular tape cartridge pool can be limited by setting the `mountlimit` attribute for the tape cartridge pool. The default is 0, which is unlimited. For more information about the `mountlimit` attribute, see 7.2, “Maximizing migration performance with redundant copies” on page 209.

- After a file is migrated to a tape cartridge pool, it cannot be migrated again to another tape cartridge pool before it is recalled.

- When tape cartridges are removed from a tape cartridge pool but not exported from IBM Spectrum Archive EE, they are no longer targets for migration or recalls.

- When tape cartridges are exported from IBM Spectrum Archive EE system by running the `eeadm tape export` command, they are removed from their tape cartridge pool and the files are not accessible for recall.

#### 6.9.1 Creating tape cartridge pools

This section describes how to create tape cartridge pools for use with IBM Spectrum Archive EE. Tape cartridge pools are logical groupings of tape cartridges within IBM Spectrum Archive EE. The groupings might be based on their intended function (for example, `OnsitePool` and `OffsitePool`) or based on their content (for example, `MPEGpool` and `JPEGpool`). However, you must create at least one tape cartridge pool.
You create tape cartridge pools by using the `create` option of the `eeadm pool` command. For example, the command that is shown in Example 6-54 creates the tape cartridge pool named MPEGpool.

**Example 6-54  Create a tape cartridge pool**

```
[root@kyoto prod]# eeadm pool create MPEGpool
```

For single tape library systems, the `-l` option (library name) can be omitted. For two tape library systems, the `-l` option is used to specify the library name.

For single node group systems, the `-g` option (node group) can be omitted. For multiple node group systems, the `-g` option is used to specify the node group.

The default tape cartridge pool type is a regular pool. If a WORM pool is wanted, supply the `--worm physical` option.

The pool names are case-sensitive and can be duplicated in different tape libraries. No informational messages are shown at the successful completion of the command. However, you can confirm that the pool was created by running the `eeadm pool list` command.

### 6.9.2 Deleting tape cartridge pools

This section describes how to delete tape cartridge pools for use with IBM Spectrum Archive EE. Delete tape cartridge pools by using the `eeadm pool delete` command. For example, the command in Example 6-55 on page 141 deletes the tape cartridge pool that is named MPEGpool.

**Example 6-55  Delete a tape cartridge pool**

```
[root@kyoto prod]# eeadm pool delete MPEGpool
```

For single tape library systems, the `-l` option (library name) can be omitted. For two tape library systems, the `-l` option is used to specify the library name.

When deleting a tape cartridge pool, the `-g` option (node group) can be omitted.

No informational messages are shown after the successful completion of the command.

**Important:** If the tape cartridge pool contains tape cartridges, the tape cartridge pool cannot be deleted until the tape cartridges are removed.

You cannot use IBM Spectrum Archive EE to delete a tape cartridge pool that still contains data.

To allow the deletion of the tape cartridge pool, you must remove all tape cartridges from it by running the `eeadm tape unassign` command, as described in 6.8.2, “Moving tape cartridges” on page 135.
6.10 Pool capacity monitoring

IBM Spectrum Archive EE allows users the ability to automatically monitor the capacity of designated pools for low space threshold or if a pool has run out of space due to a migration failure. This feature uses SNMP traps to inform administrators of such occurrences. The pool capacity monitoring feature benefits customers by giving them enough time to plan ahead before pool space is depleted.

To enable the pool capacity monitoring feature, use the `eeadm pool set` command with the `lowspacewarningenable yes` and the `nospacewarningenable yes` option, then set a threshold limit for the pool with the `lowspacewarningthreshold` option. The value for the `lowspacewarningthreshold` must be an integer and is in TiB. The pool capacity monitor thread checks each set pool for a low capacity every 30 minutes, and sends a trap every 24 hours.

Run the `eeadm pool show <pool_name>` command to view the current attributes for your pools. Example 6-56 shows the output of the attributes of a pool from the `eeadm pool show` command.

```
Example 6-56  The eeadm pool show command

[root@ltfseesrv1 ~]# eeadm pool show pool1
Attribute                  Value
poolname                   pool1
poolid                     aefeaa24-661e-48ba-8abd-d4948b020d74
devtype                    LTO
mediarestriction           none
format                     Not Applicable (0xFFFFFFFF)
worm                       no (0)
nodegroup                  G0
fillpolicy                 Default
owner                      System
mountlimit                 0
lowspacewarningenable      yes
lowspacewarningthreshold   0
nospacewarningenable       yes
mode                       normal
```

By default, the `lowspacewarningenable` and `nospacewarningenable` attributes are set to `yes`, and `lowspacewarningthreshold` is set to 0, which indicates no traps will be sent for a pool with low space. An SNMP trap is sent for no space remaining in the pool when migrations failed due to pool space being depleted.

The `lowspacewarningthreshold` attribute value is set in TiB. To modify the attributes in each pool, use the `eeadm pool set <pool_name> -a <attribute> -v <value>` command.

Example 6-57 shows the output of modifying pool1's `lowspacewarningthreshold` attribute to 2 TiB.

```
Example 6-57  Output of modifying pool1's lowspacewarningthreshold attribute

[root@kyoto prod]# eeadm pool set pool1 -a lowspacewarningthreshold -v 30

[root@kyoto prod]# eeadm pool show pool1
Attribute                  Value
poolname                   pool1
```
With `lowspacewarningthreshold` set to 30 TiB, when pool1’s capacity drops below 30 TiB, a trap will be sent to the user when the next check cycle occurs. Example 6-58 shows the traps generated when pool1’s capacity drops below 30 TiB.

Example 6-58  Traps sent when pool capacity is below the set threshold

```
2018-11-26 09:08:42 tora.tuc.stglabs.ibm.com [UDP: [9.11.244.63]:60811->[9.11.244.63]:162]:

```

### 6.11 Migration

The migration process is the most significant reason for using IBM Spectrum Archive EE. Migration is the movement of files from IBM Spectrum Scale (on disk) to LTFS tape cartridges in tape cartridge pools, which leaves behind a small stub file on the disk. This process has the obvious effect of reducing the usage of IBM Spectrum Scale. You can move less frequently accessed data to lower-cost, lower-tier tape storage from where it can be easily recalled.

IBM Spectrum Scale policies are used to specify files in the IBM Spectrum Scale namespace (through a GPFS scan) to be migrated to the LTFS tape tier. For each specified GPFS file, the file content, GPFS path, and user-defined extended attributes are stored in LTFS so that they can be re-created at import. Empty GPFS directories are not migrated.

In addition, it is possible to migrate an arbitrary list of files directly by running the `eeadm migrate` command. This task is done by specifying the file name of a scan list file that lists the files to be migrated and specifying the designated pools as command options.

**Important:** Running the Tivoli Storage Manager for Space Management `dsmmigrate` command directly is not supported.
To migrate files, the following configuration and activation prerequisites must be met:

- Ensure that the MMM service is running on an LTFS node. For more information, see 6.2.4, “IBM Spectrum Archive EE” on page 120.
- Ensure that storage pools that are not empty are created and defined. For more information, see 6.9.1, “Creating tape cartridge pools” on page 140.
- Ensure that space management is turned on. For more information, see 6.2.3, “Hierarchical Space Management” on page 118.
- Activate one of the following mechanisms to trigger migration:
  - Automated IBM Spectrum Scale policy-driven migration that uses thresholds.
  - Manual policy-based migration by running the `mmapplypolicy` command.
  - Manual migration by running the `eadm migrate` command and a prepared list of files and tape cartridge pools.

IBM Spectrum Archive EE uses a semi-sequential fill policy for tapes that enables multiple files to be written in parallel by using multiple tape drives within the tape library. Tasks are put on the queue and the scheduler looks at the queue to decide which tasks should be run. If one tape drive is available, all of the migration goes on one tape cartridge. If there are three tape drives available, the migrations are spread among the three tape drives. This configuration improves throughput and is a more efficient usage of tape drives.

IBM Spectrum Archive EE internally groups files into file lists and schedules these lists on the task queue. The lists are then distributed to available drives to perform the migrations.

The grouping is done by using two parameters: A total file size and a total number of files. The default settings for the file lists are 20 GB or 20,000 files. This requirement means that a file list can contain either 20 GB of files or 20,000 number of files, whichever fills up first, before creating a new file list. For example, if you have 10 files to migrate and each file is 10 GB in size, then when migration is kicked off, IBM Spectrum Archive EE internally generates five file lists containing two files each because the two files reach the 20 GB limit that a file list can have. It then schedules those file lists to the task queue for available drives.

For more information about performance references, see 3.4.3, “Performance” on page 47.

**Note:** Files that are recently created need to wait two minutes before being migrated. Otherwise, the migrations will fail.

Example 6-59 shows the output of running the `mmapplypolicy` command that uses a policy file called `sample_policy.txt`.

**Example 6-59 Output of the mmapplypolicy command**

```bash

6.11.1 Managing file migration pools

A file can be migrated to one pool or to multiple pools if replicas are configured. However, after the file is in the migrated state, it cannot be migrated again to other tape cartridge pools before it is recalled and made resident again by using the `eeadm recall` command with the `--resident` option. For more information about creating replicas, see 6.11.4, “Replicas and redundant copies” on page 155. Recalling the file into resident state invalidates the LTFS copy from the reconcile and export perspective.

6.11.2 Threshold-based migration

This section describes how to use IBM Spectrum Scale policies for threshold-based migrations with IBM Spectrum Archive EE.

Automated IBM Spectrum Scale policy-driven migration is a standard IBM Spectrum Scale migration procedure that allows file migration from IBM Spectrum Scale disk pools to external pools. IBM Spectrum Archive EE is configured as an external pool to IBM Spectrum Scale by using policy statements.

After you define an external tape cartridge pool, migrations or deletion rules can refer to that pool as a source or target tape cartridge pool. When the `mmapplypolicy` command is run and a rule dictates that data should be moved to an external pool, the user-provided program that is identified with the `EXEC` clause in the policy rule starts. That program receives the following arguments:

- The command to be run. IBM Spectrum Scale supports the following subcommands:
  - LIST: Provides arbitrary lists of files with no semantics on the operation.
  - MIGRATE: Migrates files to external storage and reclaims the online space that is allocated to the file.
  - PREMIGRATE: Migrates files to external storage, but does not reclaim the online space.
  - PURGE: Deletes files from both the online file system and the external storage.
  - RECALL: Recall files from external storage to the online storage.
  - TEST: Tests for presence and operation readiness. Returns zero for success and returns nonzero if the script should not be used on a specific node.

- The name of a file that contains a list of files to be migrated.

**Important:** IBM Spectrum Archive EE supports only the LIST, MIGRATE, PREMIGRATE, and RECALL subcommands.
Any optional parameters that are specified with the `OPTS` clause in the rule. These optional parameters are not interpreted by the IBM Spectrum Scale policy engine, but by the method that IBM Spectrum Archive EE uses to pass the tape cartridge pools to which the files are migrated.

To set up automated IBM Spectrum Scale policy-driven migration to IBM Spectrum Archive EE, you must configure IBM Spectrum Scale to be managed by IBM Spectrum Archive EE. In addition, a migration callback must be configured.

Callbacks are provided primarily as a method for system administrators to take notice when important IBM Spectrum Scale events occur. It registers a user-defined command that IBM Spectrum Archive EE runs when certain events occur. For example, an administrator can use the low disk event callback to inform system administrators when a file system is getting full.

The migration callback is used to register the policy engine to be run if a high threshold in a file system pool is met. For example, after your pool usage reaches 80%, you can start the migration process. You must enable the migration callback by running the `mmaddcallback` command.

In the `mmaddcallback` command in Example 6-60, the `--command` option points to a sample script file called `/usr/lpp/mmfs/bin/mmapplypolicy`. Before you run this command, you must ensure that the specified sample script file exists. The `--event` option registers the events for which the callback is configured, such as the “low disk space” events that are in the command example.

For more information about how to create and set a fail-safe policy, see 7.10, “Real world use cases for mmapplypolicy” on page 217.

```
Example 6-60   A mmaddcallback example

mmaddcallback MIGRATION --command /usr/lpp/mmfs/bin/mmapplypolicy --event
lowDiskSpace --parms "\%fsName -B 20000 -m <2x the number of drives>
--single-instance"
```

For more information, see the following publications:

- *IBM Spectrum Scale: Administration and Programming Reference Guide*, which is available at IBM Knowledge Center
- *Tivoli Field Guide - TSM for Space Management for UNIX-GPFS Integration* white paper

After the file system is configured to be managed by IBM Spectrum Archive EE and the migration callback is configured, a policy can be set up for the file system. The placement policy that defines the initial placement of newly created files and the rules for placement of restored data must be installed into IBM Spectrum Scale by using the `mmchpolicy` command. If an IBM Spectrum Scale file system does not have a placement policy installed, all the data is stored in the system storage pool.

You can define the file management rules and install them in the file system together with the placement rules by running the `mmchpolicy` command. You also can define these rules in a separate file and explicitly provide them to the `mmapplypolicy` command by using the `-P` option. The latter option is described in 6.11.3, “Manual migration” on page 151.

In either case, policy rules for placement or migration can be intermixed. Over the life of the file, data can be migrated to a different tape cartridge pool any number of times, and files can be deleted or restored.
The policy must define IBM Spectrum Archive EE (/opt/ibm/ltfsee/bin/eeadm) as an external tape cartridge pool.

**Tip:** Only one IBM Spectrum Scale policy, which can include one or more rules, can be set up for a particular GPFS file system.

After a policy is entered into a text file (such as policy.txt), you can apply the policy to the file system by running the `mmchpolicy` command. You can check the syntax of the policy before you apply it by running the command with the `-I test` option, as shown in Example 6-61.

**Example 6-61 Test an IBM Spectrum Scale policy**

```
mmchpolicy /dev/gpfs policy.txt -t "System policy for LTFS EE" -I test
```

After you test your policy, run the `mmchpolicy` command without the `-I test` to set the policy.

After a policy is set for the file system, you can check the policy by displaying it with the `mmlspolicy` command, as shown in Example 6-62. This policy migrates all files in groups of 20 GiB after the IBM Spectrum Archive disk space reaches a threshold of or above 80% in the /ibm/glues/archive directory to tape.

**Example 6-62 List an IBM Spectrum Scale policy**

```
[root@ltfs97]# mmlspolicy /dev/gpfs -L
/* LTFS EE - GPFS policy file */

define(
        user_exclude_list,
        PATH_NAME LIKE '/ibm/glues/0%' 
        OR NAME LIKE '%&%')

define(
        user_include_list,
        FALSE)

define(
        exclude_list,
        NAME LIKE 'dsmerror.log')

/* define is_premigrated uses GPFS inode attributes that mark a file as a premigrated file. Use the define to include or exclude premigrated files from the policy scan result explicitly */

define(
        is_premigrated,
        MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%')

/* define is_migrated uses GPFS inode attributes that mark a file as a migrated file. Use the define to include or exclude migrated files from the policy scan result explicitly */

define(
        is_migrated,
        MISC_ATTRIBUTES LIKE '%V%')

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'

RULE EXTERNAL POOL 'Archive_files'
```
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS -p 'pool1@libb'
SIZE(20971520)

RULE 'ARCHIVE_FILES' MIGRATE FROM POOL 'system'
THRESHOLD(80,50)
TO POOL 'Archive_files'
WHERE PATH_NAME LIKE '/ibm/glues/archive/%'
AND NOT (exclude_list)
AND (NOT (user_exclude_list) OR (user_include_list))
AND (is_migrated OR is_premigrated)

To ensure that a specified IBM Spectrum Scale is migrated only once, run the `mmapplypolicy` command with the `-single-instance` option. If this is not done, IBM Spectrum Archive EE attempts to start another migration process every two minutes. It is called every two minutes because the threshold continues to be exceeded while migrations are still in the process of migrating the data to free up the space.

As a preferred practice, the user should not use overlapping IBM Spectrum Scale policy rules within different IBM Spectrum Scale policy files that select the same files for migration to different tape cartridge pools. If a file is already migrated, later migration attempts fail, which is the standard HSM behavior. However, this is not normally done, due to incorporating thresholds.

**Important:** If a single IBM Spectrum Scale file system is used and the metadata directory is stored in the same file system that is space-managed with IBM Spectrum Archive EE, migration of the metadata directory must be prevented. The name of metadata directory is `/ibm/gpfs/.ltfsee/meta/`.

By combining the attributes of `THRESHOLD` and `WEIGHT` in IBM Spectrum Scale policies, you can have a great deal of control over the migration process. When an IBM Spectrum Scale policy is applied, each candidate file is assigned a weight (based on the `WEIGHT` attribute). All candidate files are sorted by weight and the highest weight files are chosen to `MIGRATE` until the low occupancy percentage (based on the `THRESHOLD` attribute) is achieved, or there are no more candidate files.

Example 6-63 shows a policy that starts migration of all files when the file system pool named “system” reaches 80% full (see the `THRESHOLD` attribute), and continues migration until the pool is reduced to 60% full or less by using a weight that is based on the date and time that the file was last accessed (refer to the `ACCESS_TIME` attribute). The file system usage is checked every two minutes.

All files to be migrated must have more than 5 MB of disk space that is allocated for the file (see the `KB_ALLOCATED` attribute). The migration is performed to an external pool, presented by IBM Spectrum Archive EE (`/opt/ibm/ltfsee/bin/eeadm`), and the data that is migrated is sent to the IBM Spectrum Archive EE tape cartridge pool named `Tapepool1`. In addition, this example policy excludes some system files and directories.

```plaintext
Example 6-63  Threshold-based migration in an IBM Spectrum Scale policy file

define
{
  exclude_list,
  (PATH_NAME LIKE '%/SpaceMan/%%')
}```
In addition to monitoring the file system's overall usage in Example 6-63, you can monitor how frequently a file is accessed with IBM Spectrum Scale policies. A file's access temperature is an attribute for a policy that provides a means of optimizing tiered storage. File temperatures are a relative attribute, which indicates whether a file is “hotter” or “colder” than the others in its pool.

The policy can be used to migrate hotter files to higher tiers and colder files to lower. The access temperature is an exponential moving average of the accesses to the file. As files are accessed, the temperature increases. Likewise, when the access stops, the file cools. File temperature is intended to optimize nonvolatile storage, not memory usage. Therefore, cache hits are not counted. In a similar manner, only user accesses are counted.

The access counts to a file are tracked as an exponential moving average. A file that is not accessed loses a percentage of its accesses each period. The loss percentage and period are set through the configuration variables fileHeatLossPercent and fileHeatPeriodMinutes. By default, the file access temperature is not tracked.

To use access temperature in policy, the tracking must first be enabled. To do this, set the following configuration variables:

- **fileHeatLossPercent**
  The percentage (0 - 100) of file access temperature that is dissipated over the fileHeatPeriodMinutes time. The default value is 10.

- **fileHeatPeriodMinutes**
  The number of minutes that is defined for the recalculation of file access temperature. To turn on tracking, fileHeatPeriodMinutes must be set to a nonzero value from the default value of 0. You use WEIGHT(FILE_HEAT) with a policy MIGRATE rule to prioritize migration by file temperature.
The following example sets fileHeatPeriodMinutes to 1440 (24 hours) and fileHeatLossPercent to 10, meaning that unaccessed files lose 10% of their heat value every 24 hours, or approximately 0.4% every hour (because the loss is continuous and “compounded” geometrically):

```
mmchconfig fileheatperiodminutes=1440,fileheatlosspercent=10
```

**Note:** If the updating of the file access time (atime) is suppressed or if relative atime semantics are in effect, proper calculation of the file access temperature might be adversely affected.

These examples provide only an introduction to the wide range of file attributes that migration can use in IBM Spectrum Scale policies. IBM Spectrum Scale provides a range of other policy rule statements and attributes to customize your IBM Spectrum Scale environment, but a full description of all these is outside the scope for this publication.

For syntax definitions for IBM Spectrum Scale policy rules, which correspond to constructs in this script (such as EXEC, EXTERNAL POOL, FROM POOL, MIGRATE, RULE, OPTS, THRESHOLD, TO POOL, WEIGHT, and WHERE), see the information about policy rule syntax definitions in *IBM Spectrum Scale: Administration Guide* at IBM Knowledge Center.

Also, see 7.4, “Setting mmapplypolicy options for increased performance” on page 211.

For more information about IBM Spectrum Scale SQL expressions for policy rules, which correspond to constructs in this script (such as CURRENT_TIMESTAMP, FILE_SIZE, MISC_ATTRIBUTES, NAME, and PATH_NAME), see the information about SQL expressions for policy rules in *IBM Spectrum Scale: Administration Guide* at IBM Knowledge Center.

### 6.11.3 Manual migration

In contrast to the threshold-based migration process that can be controlled only from within IBM Spectrum Scale, the manual migration of files from IBM Spectrum Scale to LTFS tape cartridges can be accomplished by running the `mmapplypolicy` command or the `eeadm` command. The use of these commands is documented in this section. Manual migration is more likely to be used for *ad hoc* migration of a file or group of files that do not fall within the standard IBM Spectrum Scale policy that is defined for the file system.

**Using mmapplypolicy**

This section describes how to manually start file migration while using an IBM Spectrum Scale policy file for file selection.

You can apply a manually created policy by manually running the `mmapplypolicy` command, or by scheduling the policy with the system scheduler. You can have multiple different policies, which can each include one or more rules. However, only one policy can be run at a time.

**Important:** Prevent migration of the `.SPACEMAN` directory of a GPFS file system by excluding the directory with an IBM Spectrum Scale policy rule.

You can accomplish manual file migration for an IBM Spectrum Scale file system that is managed by IBM Spectrum Archive EE by running the `mmapplypolicy` command. This command runs a policy that selects files according to certain criteria, and then passes these files to IBM Spectrum Archive EE for migration. As with automated IBM Spectrum Scale policy-driven migrations, the name of the target IBM Spectrum Archive EE tape cartridge pool is provided as the first option of the pool definition rule in the IBM Spectrum Scale policy file.
The following phases occur when the `mmapplypolicy` command is started:

1. **Phase 1: Selecting candidate files**
   In this phase of the `mmapplypolicy` job, all files within the specified GPFS file system device (or below the input path name) are scanned. The attributes of each file are read from the file’s GPFS inode structure.

2. **Phase two: Choosing and scheduling files**
   In this phase of the `mmapplypolicy` job, some or all of the candidate files are chosen. Chosen files are scheduled for migration, accounting for the weights and thresholds that are determined in phase one.

3. **Phase three: Migrating and premigrating files**
   In the third phase of the `mmapplypolicy` job, the candidate files that were chosen and scheduled by the second phase are migrated or premigrated, each according to its applicable rule.

For more information about the `mmapplypolicy` command and other information about IBM Spectrum Scale policy rules, see the *IBM Spectrum Scale: Administration Guide*, which is available at IBM Knowledge Center.

**Important:** In a multicluster environment, the scope of the `mmapplypolicy` command is limited to the nodes in the cluster that owns the file system.

**Hints and tips**

Before you write and apply policies, consider the following points:

- Always test your rules by running the `mmapplypolicy` command with the `-I test` option and the `-L 3` (or higher) option before they are applied in a production environment. This step helps you understand which files are selected as candidates and which candidates are chosen.

- To view all selected files that have been chosen for migration, run the `mmapplypolicy` command with the `-I defer` and the `-f /tmp` options. The `-I defer` option runs the actual policy without making any data movements. The `-f /tmp` option specifies a directory or file to which each migration rule is output. This option is helpful when dealing with many files.

- Do not apply a policy to an entire file system of vital files until you are confident that the rules correctly express your intentions. To test your rules, find or create a subdirectory with a modest number of files, some that you expect to be selected by your SQL policy rules and some that you expect are skipped.

  Run the following command:
  ```sh
  mmapplypolicy /ibm/gpfs/TestSubdirectory -L 6 -I test
  ```
  The output shows you exactly which files are scanned and which ones match rules.

**Testing an IBM Spectrum Scale policy**

Example 6-64 shows a `mmapplypolicy` command that tests, but does not apply, an IBM Spectrum Scale policy by using the `testpolicy` policy file.

**Example 6-64 Test an IBM Spectrum Scale policy**

```sh
[root@kyoto ~]# mmapplypolicy /ibm/gpfs/prod -P sample_policy.txt -I test
[I] GPFS Current Data Pool Utilization in KB and %

<td>15435038720</td>
<td>9.641996363%</td>
</tr>
</tbody>
</table>
The policy in Example 6-64 on page 152 is configured to select files that have the file extension .IMG for migration to the IBM Spectrum Archive EE tape cartridge pool named copy_ltfsm1 in library name lib_ltfsm1 if the usage of the /ibm/gpfs file system exceeds 50% for any .IMG file that exceeds 5 MB.

Using eeadm

The eeadm migrate command requires a migration list file that contains a list of files to be migrated with the name of the target tape cartridge pool. Unlike migrating files by using IBM Spectrum Scale policy, it is not possible to use wildcards in place of file names. The name and path of each file to be migrated must be specified in full. The file must be in the following format:

```
   -- /ibm/glues/file1.mpeg
   -- /ibm/glues/file2.mpeg
```

*Note: Make sure that there is a space before and after the "--".*

Example 6-65 shows the output of running such a migrate command.

```
[root@kyoto prod]# eeadm migrate gpfs-scan.txt -p MPEGpool
2019-01-08 15:40:44 GLESL700I: Task migrate was created successfully, task id is 18864.
2019-01-08 15:40:44 GLESM896I: Starting the stage 1 of 3 for migration task 18864 (qualifying the state of migration candidate files).
2019-01-08 15:40:44 GLESM897I: Starting the stage 2 of 3 for migration task 18864 (copying the files to 1 pools).
2019-01-08 15:40:56 GLESM898I: Starting the stage 3 of 3 for migration task 18864 (changing the state of files on disk).
2019-01-08 15:40:57 GLESL038I: Migration result: 10 succeeded, 0 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.
```

Using a cron job

Migrations that use the eeadm and mmapplypolicy commands can be automated by scheduling cron jobs, which is possible by setting a cron job that periodically triggers migrations by calling mmapplypolicy with eeadm as an external program. In this case, the full path to eeadm must be specified. The following are steps to start the crond process and create a cron job:

1. Start the crond process from by running `/etc/rc.d/init.d/crond start` or `/etc/init.d/crond start`.
2. Create a crontab job by opening the crontab editor with the crontab -e command. If using VIM to edit the jobs, press i to enter insert mode to start typing.
3. Enter the frequency and command that you would like to run.
4. After entering the jobs you would like to run, exit the editor. If using VIM, press the Escape key and enter :wq. If using nano, press Ctrl + x. This combination opens the save options. Then, press y to save the file and then Enter to override the file name.
5. View that the cron job has been created by running crontab -l.
The syntax for a cron job is `m h dom mon dow command`. In this syntax, `m` stands for minutes, `h` stands for hours, `dom` stands for day of month, `mon` stands for month, and `dow` stands for day of week. The hour parameter is in a 24-hour period, so 0 represents midnight and 12 represents noon.

Example 6-66 shows how to start the `crond` process and create a single cron job that performs migrations every six hours.

**Example 6-66  Creating a cron job for migrations to run every 6 hours**

```bash
[root@ltfseesrv ~]# /etc/rc.d/init.d/crond start
Starting crond:                                            [ OK ]
[root@ltfseesrv ~]# crontab -e
00 0,6,12,18 * * * /usr/lpp/mmfs/bin/mmapplypolicy gpfs -P
/root/premigration_policy.txt -B 20000 -m 16
crontab: installing new crontab
[root@ltfseesrv ~]# crontab -l
00 0,6,12,18 * * * /usr/lpp/mmfs/bin/mmapplypolicy gpfs -P
/root/premigration_policy.txt -B 20000 -m 16
```

### 6.11.4 Replicas and redundant copies

This section introduces how replicas and redundant copies are used with IBM Spectrum Archive EE and describes how to create replicas of migrated files during the migration process.

**Overview**

IBM Spectrum Archive EE enables the creation of a replica of each IBM Spectrum Scale file during the migration process. The purpose of the replica function is to enable creating multiple LTFS copies of each GPFS file during migration that can be used for disaster recovery, including across two tape libraries at two different locations.

The first replica is the primary copy, and more replicas are called redundant copies. Redundant copies must be created in tape cartridge pools that are different from the pool of the primary replica and from the pools of other redundant copies. Up to two redundant copies can be created (for a total of three copies of the file on various tapes).

The tape cartridge where the primary replica is stored and the tape cartridges that contain the redundant copies are referenced in the GPFS inode with an IBM Spectrum Archive EE DMAPI attribute. The primary replica is always listed first.

For transparent recalls such as double-clicks of a file or through application reads, IBM Spectrum Archive EE always performs the recall by using the primary copy tape. The primary copy is the first tape cartridge pool that is defined by the migration process. If the primary copy tape cannot be accessed, including recall failures, then IBM Spectrum Archive EE automatically tries the recall task again by using the remaining replicas if they are available during the initial migration process. This automatic retry operation is transparent to the transparent recall requester.

For selective recalls initiated by the `eeadm recall` command, an available copy is selected from the available replicas and the recall task is generated against the selected tape cartridge. There are no retries. The selection is based on the available copies in the tape library, which is supplied by the `-1` option in a two-tape library environment.
When a migrated file is recalled for a write operation or truncated, the file is marked as resident and the pointers to tape are dereferenced. The remaining copies are no longer referenced and are removed during the reconciliation process. In the case of a truncate to 0 operation, it does not generate a recall from tape. The truncated 0 file is marked as resident only.

Redundant copies are written to their corresponding tape cartridges in the IBM Spectrum Archive EE format. These tape cartridges can be reconciled, exported, reclaimed, or imported by using the same commands and procedures that are used for standard migration without replica creation.

Creating replicas and redundant copies

You can create replicas and redundant copies during automated IBM Spectrum Scale policy-based migrations or during manual migrations by running the `eeadm migrate` (or `eeadm premigrate`) command.

If an IBM Spectrum Scale scan is used and you use a scan policy file to specify files for migration, you must modify the `OPTS` line of the policy file to specify the tape cartridge pool for the primary replica and different tape cartridge pools for each redundant copy. The tape cartridge pool for the primary replica (including primary library) is listed first, followed by the tape cartridge pools for each copy (including a secondary library), as shown in Example 6-67.

A pool cannot be listed more than once in the `OPTS` line. If a pool is listed more than once per line, the file is not migrated. Example 6-67 shows the `OPTS` line in a policy file, which makes replicas of files in two tape cartridge pools in a single tape library.

Example 6-67  Extract from IBM Spectrum Scale policy file for replicas

```
OPTS '[-p PrimPool@PrimLib CopyPool@PrimLib]
```

For more information about IBM Spectrum Scale policy files, see 6.11.2, “Threshold-based migration” on page 146.

If you are running the `eeadm migrate` (or `eeadm premigrate`) command, a scan list file must be passed along with the designated pools to which the user wants to migrate the files. This process can be done by calling `eeadm migrate <inputfile> -p <list_of_pools> [OPTIONS]` (or `eeadm premigrate`).

Example 6-68 shows what the scan list looks like when selecting files to migrate.

Example 6-68  Example scan list file

```
[root@ltfs97 /]# cat migrate.txt
-- /ibm/glues/document10.txt
-- /ibm/glues/document20.txt
```

Example 6-69 shows how one would run a manual migration using the `eeadm migrate` command on the scan list from Example 6-68 to two tapes.

Example 6-69  Creation of replicas during migration

```
[root@kyoto prod]# eeadm migrate mig -p pool1 pool2
2019-01-08 15:52:39 GLESL700I: Task migrate was created successfully, task id is 18866.
2019-01-08 15:52:39 GLESM896I: Starting the stage 1 of 3 for migration task 18866 (qualifying the state of migration candidate files).
```
IBM Spectrum Archive EE attempts to create redundant copies as efficiently as possible with a minimum number of mount and unmount steps. For example, if all tape drives are loaded with tape cartridges that belong only to the primary copy tape cartridge pool, data is written to them before IBM Spectrum Archive EE begins loading the tape cartridges that belong to the redundant copy tape cartridge pools. For more information, see 3.4.1, “IBM Spectrum Archive EE metadata file system” on page 46.

By monitoring the `eeadm task list` and the `eeadm task show` command as the migration is running, you can observe the status of the migration task, as shown in Example 6-70.

**Example 6-70   Migration task status**

```
[root@mikasa1 ~]# eeadm task list
TaskID  Type     Priority  Status   #DRV  CreatedTime(-0700)   StartedTime(-0700)

[root@mikasa1 ~]# eeadm task list
TaskID  Type     Priority  Status   #DRV  CreatedTime(-0700)   StartedTime(-0700)

[root@mikasa1 ~]# eeadm task show 7014
=== Task Information ===

Result Summary:       2 succeeded, 0 failed, 0 duplicate, 0 duplicate wrong pool,
                      0 not found, 0 too small, 0 too early.
                      (GLESM899I) All files have been successfully copied on
                      pool2/lib_saitama.
                      (GLESM899I) All files have been successfully copied on
                      test2/lib_saitama.

For more information and command syntax, see the eeadm migrate command in 6.11, “Migration” on page 143.

Considerations
Consider the following points when replicas are used:

- Redundant copies must be created in different tape cartridge pools. The pool of the primary replica must be different from the pool for the first redundant copy, which, in turn, must be different from the pool for the second redundant copy.

- The migration of a premigrated file does not create replicas.

If offsite tapes are required, redundant copies can be exported out of the tape library and shipped to an offsite location after running the export offline. A second option would be to create the redundant copy in a different tape library.

6.11.5 Data Migration

Because of the need to upgrade tape generations or reuse tape cartridges, IBM Spectrum Archive EE allows users to specify to which tape cartridges they want their data to be migrated. Use the eeadm tape datamigrate command to perform pool-to-pool file migrations. This is ideal to use when newer tape generations are being introduced into the user's environment and the older generations are no longer needed.

Data on older generation media can be moved as a whole within a pool or specific tapes can be chosen in chunks. Example 6-71 shows how users can use the eeadm tape datamigrate command to migrate their data from an older generation pool to a newer one.

Example 6-71   Migrating data to newer generation tape pool

[root@mikasa1 prod]# eeadm tape datamigrate -p test3 -d test4 -l lib_saitama
2019-01-09 14:32:52 GLESL700I: Task datamigrate was created successfully, task id is 7106.
2019-01-09 14:32:52 GLESL385I: Start the "eeadm tape datamigrate" command by reclaim operation.
Processing 1 tapes in the following list of tapes from source pool test3.
The files in the tapes are moved to the tapes in target pool test4:
2019-01-09 14:32:52 GLESL677I: Files in tape JCB610JC are copied to tape JD0321JD.
2019-01-09 14:38:43 GLESL085I: Tape JCB610JC successfully reclaimed as datamigrate process, it remains in tape pool test3.
For the `eeadm tape datamigrate` command syntax, see “The eadm <resource type> <action> --help command” on page 283.

Note: The following applies to both `eeadm tape datamigrate` and `eeadm tape reclaim` commands.

If the tapes are not specified for data migration the tapes being reclaimed remain in the source pool until the user manually repurposes them. If the tapes are specified with the `eeadm tape datamigrate` command, those tapes will be removed from the source pool after the reclamation completes.

In addition to the pool-to-pool data migration, users can perform in-pool data migration by configuring the pool settings and modifying the `mediarestriction` or `format` type to make older generation media become `append_fenced`. By doing so, in addition to securing future migration tasks go to newer generation media this also enables users to run reclamation on those older generation tape cartridges and have assurance that the data is reclaimed onto the new generation medias.

When changing the `mediarestriction` attribute of the pool, the format type is also automatically updated to the highest gen drive available to the cluster. The `format` attribute is automatically updated only after each time the `mediarestriction` is modified. If new drive and media generations are added to a cluster with `mediarestriction` already set, users are expected to update `format` or `mediarestriction` manually to support new media generations.

Example 6-72 on page 159 shows the automatic format update when changing the `mediarestriction` attribute from JC to JE when there are TS1160, TS1155, and TS1150 drives.

Example 6-72  Updating pool mediarestriction

```
[root@mikasa1 prod]# eeadm pool show test3 -l lib_saitama
Attribute                  Value
poolname                   test3
poolid                     99096daa-0beb-4791-b24f-672804a56440
devtype                    3592
mediarestriction           JC
format                     E08 (0x55)
worm                       no (0)
nodegroup                  G0
fillpolicy                 Default
owner                      System
mountlimit                 0
lowspacewarningenable      yes
lowspacewarningthreshold   0
nospacewarningenable       yes
mode                       normal

[root@mikasa1 prod]# eeadm pool set test3 -l lib_saitama -a mediarestriction -v JE

[root@mikasa1 prod]# eeadm pool show test3 -l lib_saitama
Attribute                  Value
poolname                   test3
```
poolid                     99096daa-0beb-4791-b24f-672804a56440
devtype                    3592
mediarestriction           JE
format                     60F (0x57)
worm                       no (0)
nodegroup                  G0
fillpolicy                 Default
owner                      System
mountlimit                 0
lowspacewarningenable      yes
lowspacewarningthreshold   0
nospacewarningenable       yes
mode                       normal

All tapes within test3 that fall under the restriction of JE media and 60F format type are all appendable tapes, and everything else is now append_fenced.

6.11.6 Migration hints and tips

This section provides preferred practices for successfully managing the migration of files.

Overlapping IBM Spectrum Scale policy rules

After a file is migrated to a tape cartridge pool and is in the migrated state, it cannot be migrated to other tape cartridge pools (unless it is first recalled).

It is preferable that you do not use overlapping IBM Spectrum Scale policy rules within different IBM Spectrum Scale policy files that can select the same files for migration to different tape cartridge pools. If a file is already migrated, a later migration fails.

In this example, an attempt is made to migrate four files to tape cartridge pool pool2. Before the migration attempt, tape JCB610JC, which is defined in a different tape cartridge pool (pool1), already contains three of the four files. The state of the files on these tape cartridges before the migration attempt is displayed by the eeadm file state command as shown in Example 6-73.

Example 6-73  Before migration

[root@mikasa1 prod]# eeadm file state *.bin
Name: /ibm/gpfs/prod/fileA.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-1939041988-3068866-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileB.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-1844785692-3068794-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileC.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-373707969-3068783-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileD.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-373707969-3068783-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileE.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-1939041988-3068866-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)
The attempt to migrate the files to a different tape cartridge pool produces the results that are shown in Example 6-74.

**Example 6-74   Attempted migration of already migrated files**

```bash
[root@mikasa1 prod]# eeadm migrate mig -p pool2@lib_saitama
2019-01-09 15:07:18 GLESL700I: Task migrate was created successfully, task id is 7110.
2019-01-09 15:07:18 GLESM896I: Starting the stage 1 of 3 for migration task 7110 (qualifying the state of migration candidate files).
2019-01-09 15:07:18 GLESM897I: Starting the stage 2 of 3 for migration task 7110 (copying the files to 1 pools).
2019-01-09 15:07:30 GLESM898I: Starting the stage 3 of 3 for migration task 7110 (changing the state of files on disk).
2019-01-09 15:07:31 GLESL159E: Not all migration has been successful.
2019-01-09 15:07:31 GLESL038I: Migration result: 1 succeeded, 3 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.
```

If the IBM Spectrum Archive EE log is viewed, the error messages that are shown in Example 6-75 explain the reason for the failures.

**Example 6-75   Migration errors reported in the IBM Spectrum Archive EE log file**

```bash
2019-01-09T15:07:18.713348-07:00 saitama2 mmm[22592]: GLESM148E(00710): File /ibm/gpfs/prod/fileA.ppt is already migrated and will be skipped.
2019-01-09T15:07:18.713413-07:00 saitama2 mmm[22592]: GLESM148E(00710): File /ibm/gpfs/prod/fileB.ppt is already migrated and will be skipped.
2019-01-09T15:07:18.715196-07:00 saitama2 mmm[22592]: GLESM148E(00710): File /ibm/gpfs/prod/fileC.ppt is already migrated and will be skipped.
```

The files on tape JCB610JC (fileA.ppt, fileB.ppt, and fileC.ppt) are already in storage pool pool1. Therefore, the attempt to migrate them to storage pool pool2 produces a migration result of Failed. Only the attempt to migrate the resident file fileD.ppt succeeds.

If the aim of this migration was to make redundant replicas of the four PPT files in the pool2 tape cartridge pool, the method that is described in 6.11.4, “Replicas and redundant copies” on page 155 must be followed instead.

**IBM Spectrum Scale policy for the .SPACEMAN directory**

Prevent migration of the .SPACEMAN directory of an IBM Spectrum Scale by excluding the directory with an IBM Spectrum Scale policy rule. An example is shown in Example 6-63 on page 149.

**Automated IBM Spectrum Scale policy-driven migration**

To ensure that a specified GPFS file system is migrated only once, run the `mmapplypolicy` command with the `--single-instance` option. The `--single-instance` option ensures that multiple `mmapplypolicy` commands are not running in parallel because it can take longer than two minutes to migrate a list of files to tape cartridges.
**Tape format**
For more information about the format of tapes that are created by the migration process, see 10.2, “Formats for IBM Spectrum Scale to IBM Spectrum Archive EE migration” on page 290.

**Migration Policy**
A migration policy is used to make your lives easier. When run, IBM Spectrum Scale performs a scan of all candidate files in the IBM Spectrum Archive name space to be migrated onto tape. This process saves the user lots of time because they do not need to manually search their file system and find candidate files for migrations. This feature is especially important when there are millions of files created. For use cases on migration policy, see 7.10, “Real world use cases for mmapplypolicy” on page 217.

### 6.12 Premigration

A premigrated file is a file that is on both disk and tape. To change a file to a premigrated state, you have two options:

- Recalling migrated files:
  a. The file initially is only on a disk (the file state is *resident*).
  b. The file is migrated to tape by running `eeadm migrate`. After this migration, the file is a stub on the disk (the file state is migrated) and the IDs of the tapes containing the redundant copies are written to an IBM Spectrum Archive EE DMAPI attribute.
  c. The file is recalled from tape by using a recall for read when a client attempts to read from the file. The file is on both disk and tape (the file state is *premigrated*).

- Premigrating files:
  a. The file initially is only on disk (the file state is *resident*).
  b. The file is premigrated to tape by running `eeadm premigrate`. The IDs of the tapes that contain the redundant copies are written to an IBM Spectrum Archive EE DMAPI attribute.

Premigration works similar to migration:
- The premigration scan list file has the same format as the migration scan list file.
- Up to two more redundant copies are allowed (the same as with migration).
- Manual premigration is available by running either `eeadm premigrate` or `mmapplypolicy`.
- Automatic premigration is available by running `eeadm premigrate` through the `mmapplypolicy/mmaddcallback` command or a cron job.
- Migration hints and tips are applicable to premigration.

For the `eeadm migrate` command, each migrate task is achieved internally by splitting the work into three steps:
1. Writing the content of the file to tapes, including redundant copies.
2. Writing the IDs of the tapes that contain the redundant copies of the file, which are written to an IBM Spectrum Archive EE DMAPI attribute.
3. Stubbing the file on disk.

For premigration, step 3 is not performed. The omission of this step is the only difference between premigration and migration.
6.12.1 Premigration with the eeadm premigrate command

The **eeadm premigrate** command is used to premigrate non-empty regular files to tape. The command syntax is the same as for the **eeadm migrate** command. The following is an example of the syntax:

```plaintext
eeadm premigrate <inputfile> -p <list_of_pools> [OPTIONS]
```

The `<input_file>` file includes the list of non-empty regular files to be premigrated. Each line of this file must end with `-- <full path filename>`. All file system objects are saved to the specified target tape cartridge pool. Optionally, the target tape cartridge pool can be followed by up to two more tape cartridge pools (for redundant copies) separated by spaces.

6.12.2 Premigration running the mmapplypolicy command

To perform premigration by running the **mmapplypolicy** command, the THRESHOLD clause is used to determine the files for premigration. There is no IBM Spectrum Scale **premigrate** command, and the default behavior is to not premigrate files.

The THRESHOLD clause can have the following parameters to control migration and premigration:

**THRESHOLD (high percentage, low percentage, premigrate percentage)**

If no premigrate threshold is set with the THRESHOLD clause or a value is set greater than or equal to the low threshold, then the **mmapplypolicy** command does not premigrate files. If the premigrate threshold is set to zero, the **mmapplypolicy** command premigrates all files.

For example, the following rule premigrates all files if the storage pool occupancy is 0 - 30%. When the storage pool occupancy is 30% or higher, files are migrated until the storage pool occupancy drops below 30%. Then, it continues by premigrating all files:

```plaintext
RULE 'premig1' MIGRATE FROM POOL 'system' THRESHOLD (0,30,0) TO POOL 'ltfs'
```

The rule in the following example takes effect when the storage pool occupancy is higher than 50%. Then, it migrates files until the storage pool occupancy is lower than 30%, after which it premigrates the remaining files:

```plaintext
RULE 'premig2' MIGRATE FROM POOL 'system' THRESHOLD (50,30,0) TO POOL 'ltfs'
```

The rule in the following example is configured so that if the storage pool occupancy is below 30%, it selects all files that are larger than 5 MB for premigration. Otherwise, when the storage pool occupancy is 30% or higher, the policy migrates files that are larger than 5 MB until the storage pool occupancy drops below 30%.

Then, it continues by premigrating all files that are larger than 5 MB:

```plaintext
RULE 'premig3' MIGRATE FROM POOL 'system' THRESHOLD (0,30,0) TO POOL 'ltfs' WHERE(KB_ALLOCATED > 5120)
```

The rule in the following example is the preferred rule when performing premigrations only. It requires a callback to perform the stubbing. If the storage pools occupancy is below 100%, it selects all files larger than 5 MB for premigration. If you set the threshold to 100% the storage pools occupancy will never exceed this value, and so migrations will not be performed. In this case, a callback is needed to run the stubbing. For an example of a callback, see 7.10.2, “Creating active archive system policies" on page 218.

```plaintext
RULE 'premig4' MIGRATE FROM POOL 'system' THRESHOLD (0,100,0) TO POOL 'ltfs' WHERE(FILE_SIZE > 5242880)
```
6.13 Preserving file system objects on tape

Symbolic links, empty regular files, and empty directories are some file system objects that do not contain data or content. When you save these types of file system objects, you cannot use migration and premigration commands. HSM is used to move data to and from tapes, that is, for space management.

Because these file system objects do not have data, they cannot be processed by migration or premigration. A new driver (called the save driver) was introduced to save these file system objects to tape.

The following items (data and metadata that is associated with an object) are written and read to and from tapes:

- File data for non-empty regular files
- Path and file name for all objects
- Target symbolic name only for symbolic links
- User-defined extended attributes for all objects except symbolic links

The following items are not written and read to and from tapes:

- Timestamps
- User ID and group ID
- ACLs

To save these file system objects on tape, you have two options:

- Calling the eeadm save command directly with a scan list file
- An IBM Spectrum Scale policy with the mmapplypolicy command

6.13.1 Saving file system objects with the eeadm save command

The eeadm save command is used to save symbolic links, empty regular files, and empty directories to tape. The command syntax is the same as the eeadm migrate or eeadm premigrate commands. The following is the syntax of the eeadm save command:

```
eeadm save <inputfile> -p <list_of_pools> [OPTIONS]
```

The `<inputfile>` file includes the list of file system objects (symbolic links, empty regular files, and empty directories) to be saved. Each line of this file must end with -- <full path file system object name>.

All file system objects are saved to the specified target tape cartridge pool. Optionally, the target tape cartridge pool can be followed by up to two more tape cartridge pools (for redundant copies) separated by spaces.

**Note:** This command is not applicable for non-empty regular files.

6.13.2 Saving file system objects with policies

Migration and premigration cannot be used for file system objects that do not occupy space for data. To save file system objects, such as symbolic links, empty regular files, and empty directories with an IBM Spectrum Scale policy, the IBM Spectrum Scale list rule must be used.
A working policy sample of IBM Spectrum Scale list rules to save these file system objects without data to tape can be found in the `/opt/ibm/ltfsee/data/sample_save.policy` file. The only change that is required to the following sample policy file is the specification of the cartridge pool (in blue colored letters).

These three list rules can be integrated into existing IBM Spectrum Scale policies. Example 6-76 shows the sample policy.

**Example 6-76  Sample policy to save file system objects without data to tape**

```c
/*
 Sample policy rules
to save
 symbolic links,
 empty directories and
 empty regular files
*/

RULE
EXTERNAL LIST 'emptyobjects'
EXEC '/opt/ibm/ltfsee/bin/ltfseesave'
OPTS '-p sample_pool'

define(DISP_XATTR,
 CASE
 WHEN XATTR($1) IS NULL
  THEN '_NULL_'
 ELSE XATTR($1)
 END
)

RULE 'symoliclinks'
LIST 'emptyobjects'
DIRECTORIES_PLUS
/*
 SHOW ('mode=' || SUBSTR(MODE,1,1) ||
   'stime=' || DISP_XATTR('dmapi.IBMSTIME') ||
   'ctime=' || VARCHAR(CHANGE_TIME) ||
   'spath=' || DISP_XATTR('dmapi.IBMSPATH'))
*/
WHERE
( /* if the object is a symbolic link */
   MISC_ATTRIBUTES LIKE '%L%
 )
AND
( PATH_NAME NOT LIKE '%/.SpaceMan/%'
 )
AND
( /* if the object has not been saved yet */
   XATTR('dmapi.IBMSTIME') IS NULL
   AND
   XATTR('dmapi.IBMSPATH') IS NULL
 )
OR
```
RULE 'directories'
LIST 'emptyobjects'
DIRECTORIES_PLUS
/*
SHOW ('mode=' || SUBSTR(MODE,1,1) || ' stime=' || Disp_XATTR('dmapi.IBMSTIME') || ' ctime=' || VARCHAR(CHANGE_TIME) || ' spath=' || Disp_XATTR('dmapi.IBMSPATH')) */
WHERE
( /* if the object is a directory */
  MISC_ATTRIBUTES LIKE 'D' 
) AND
  PATH_NAME NOT LIKE '%/.SpaceMan'
  AND
  PATH_NAME NOT LIKE '%/.SpaceMan/%'
) AND
( /* directory's emptiness is checked in the later processing */
  /* if the object has not been saved yet */
  XATTR('dmapi.IBMSTIME') IS NULL
  AND
  XATTR('dmapi.IBMSPATH') IS NULL
) OR
( /* if the object is modified or renamed after it was saved */
  TIMESTAMP(XATTR('dmapi.IBMSTIME')) < TIMESTAMP(CHANGE_TIME)
  OR
  XATTR('dmapi.IBMSPATH') != PATH_NAME
)
)

RULE 'emptyregularfiles'
LIST 'emptyobjects'
/*
SHOW ('mode=' || SUBSTR(MODE,1,1) || ' stime=' || Disp_XATTR('dmapi.IBMSTIME') || ' ctime=' || VARCHAR(CHANGE_TIME) || ' spath=' || Disp_XATTR('dmapi.IBMSPATH')) */
WHERE
( /* if the object is a regular file */
  MISC_ATTRIBUTES LIKE 'F'
) AND
6.14 Recall

In space management solutions, there are two different types of recall possibilities: Transparent and selective recall processing. Both are possible with the current IBM Spectrum Archive EE implementation.

Transparent recalls are initiated by an application that tries to read, write, or truncate a migrated file while not being aware that it was migrated. The specific I/O request that initiated the recall of the file is fulfilled, with a possible delay because the file data is not available immediately (it is on tape).

For transparent recalls, it is difficult to do an optimization because it is not possible to predict when the next transparent recall will happen. Some optimization is already possible because within the IBM Spectrum Archive EE task queue, the requests are run in an order that is based on the tape and the starting block to which a file is migrated. This becomes effective only if requests happen close together in time.

Furthermore, with the default IBM Spectrum Archive EE settings, there is a limitation of up to only 60 transparent recalls possible on the IBM Spectrum Archive EE task queue. A 61st request appears only if one of the previous 60 transparent recall requests completes. Therefore, the ordering can happen only on this small 60 transparent recall subset. It is up to the software application to send the transparent recalls in parallel to have multiple transparent recalls to run at the same time.

Selective recalls are initiated by users that are aware that the file data is on tape and they want to transfer it back to disk before an application accesses the data. This action avoids delays within the application that is accessing the corresponding files.
Contrary to transparent recalls, the performance objective for selective recalls is to provide the best possible throughput for the complete set of files that is being recalled, disregarding the response time for any individual file.

However, to provide reasonable response times for transparent recalls in scenarios where recall of many files is in progress, the processing of transparent recalls are modified to have higher priority than selective recalls. Selective recalls are performed differently than transparent recalls, and so they do not have a limitation like transparent recalls.

Recalls have higher priority than other IBM Spectrum Archive EE operations. For example, if there is a recall request for a file on a tape cartridge being reclaimed or for a file on the tape cartridge being used as reclamation target, the reclamation task is stopped, the recall or recalls from the tape cartridge that is needed for recall are served, and then the reclamation resumes automatically.

Recalls also have higher priority over tape premigration processes. They are optimized across tapes and optimized within a tape used for premigration activities. The recalls that are in close proximity are given priority.

### 6.14.1 Transparent recall

Transparent recall processing automatically returns migrated file data to its originating local file system when you access it. After the data is recalled by reading the file, the HSM client leaves the copy of the file in the tape cartridge pool, but changes it to a premigrated file because an identical copy exists on your local file system and in the tape cartridge pool. If you do not modify the file, it remains premigrated until it again becomes eligible for migration. A transparent recall process waits for a tape drive to become available.

If you modify or truncate a recalled file, it becomes a resident file. The next time your file system is reconciled, MMM marks the stored copy for deletion.

The order of selection from the replicas is always the same. The primary copy is always selected first from which to be recalled. If this recall from the primary copy fails or is not accessible, then IBM Spectrum Archive EE automatically retries the transparent recall operation against the other replicas if they exist.

**Note:** Transparent recall is used most frequently because it is activated when you access a migrated file, such as opening a file.

### 6.14.2 Selective recall using the eeadm recall command

The `eeadm recall` command performs selective recalls of migrated files to the local file system. This command performs selective recalls in multiple ways:

- Using a recall list file
- Using an IBM Spectrum Scale scan list file
- From the output of another command
- Using an IBM Spectrum Scale scan list file that is generated through an IBM Spectrum Scale policy and the `mmapplypolicy` command
With multiple tape libraries configured, the `eeadm recall` command requires the `-l` option to specify the tape library from which to recall. When a file is recalled, the recall can occur on any of the tapes (that is, either primary or redundant copies) from the specified tape library. The following conditions are applied to determine the best replica:

- The condition of the tape
- If a tape is mounted
- If a tape is mounting
- If there are tasks that are assigned to a tape

If conditions are equal between certain tapes, the primary tape is preferred over the redundant copy tapes. The secondary tape is preferred over the third tape. These rules are necessary to make the tape selection predictive. However, there are no automatic retries like with transparent recalls.

For example, if a primary tape is not mounted but a redundant copy is, the redundant copy tape is used for the recall task to avoid unnecessary mount operations.

If the specified tape library does not have any replicas, IBM Spectrum Archive EE automatically resubmits the request to the other tape library to process the bulk recalls:

- Three copies: TAPE1@Library1 TAPE2@Library1 TAPE3@Library2
  - If `-l Library1` → TAPE1 or TAPE2
  - If `-l Library2` → TAPE3
- Two copies: TAPE1@Library1 TAPE2@Library1
  - If `-l Library1` → TAPE1 or TAPE2
  - If `-l Library2` → TAPE1 or TAPE2

The `eeadm recall` command

The `eeadm recall` command is used to recall non-empty regular files from tape. The `eeadm recall` command uses the following syntax:

```bash
eeadm recall <inputfile> [OPTIONS]
```

The `<inputfile>` may contain one of two formats. Each line ends with `"-- <filename>"` with a space before and after the double dash. Or each line contains a file name with an absolute path or a relative path that is based on the working directory. The `eeadm recall` command with the output of another command.

The `eeadm recall` command can take as input the output of other commands through a pipe. In Example 6-77, all files with names ending with `.bin` are recalled under the `/ibm/gpfs/prod` directory, including subdirectories. Therefore, it is convenient to recall whole directories with a simple command.

**Example 6-77** The `eeadm recall` command with the output of another command

```
[root@saitama2 prod]# find /ibm/gpfs/prod -name "*.bin" -print | eeadm recall -l lib_saitama
2019-01-09 15:55:02 GLESL277I: The "eeadm recall command" is called without specifying an input file waiting for standard input.
2019-01-09 15:55:02 GLESL268I: 4 file name(s) have been provided to recall.
2019-01-09 15:55:03 GLESL700I: Task selective_recall was created successfully, task id is 7112.
2019-01-09 15:55:09 GLESL263I: Recall result: 4 succeeded, 0 failed, 0 duplicate, 0 not migrated, 0 not found, 0 unknown.
```
6.14.3 Read Starts Recalls: Early trigger for recalling a migrated file

IBM Spectrum Archive EE can define a stub size for migrated files so that the stub size initial bytes of a migrated file are kept on disk while the entire file is migrated to tape. The migrated file bytes that are kept on the disk are called the stub. Reading from the stub does not trigger a recall of the rest of the file. After the file is read beyond the stub, the recall is triggered. The recall might take a long time while the entire file is read from tape because a tape mount might be required, and it takes time to position the tape before data can be recalled from tape.

When Read Start Recalls (RSR) is enabled for a file, the first read from the stub file triggers a recall of the complete file in the background (asynchronous). Reads from the stubs are still possible while the rest of the file is being recalled. After the rest of the file is recalled to disks, reads from any file part are possible.

With the Preview Size (PS) value, a preview size can be set to define the initial file part size for which any reads from the resident file part does not trigger a recall. Typically, the PS value is large enough to see whether a recall of the rest of the file is required without triggering a recall for reading from every stub. This process is important to prevent unintended massive recalls. The PS value can be set only smaller than or equal to the stub size.

This feature is useful, for example, when playing migrated video files. While the initial stub size part of a video file is played, the rest of the video file can be recalled to prevent a pause when it plays beyond the stub size. You must set the stub size and preview size to be large enough to buffer the time that is required to recall the file from tape without triggering recall storms.

Use the following `dsmmigfs` command options to set both the stub size and preview size of the file system being managed by IBM Spectrum Archive EE:

```
dsmmigfs Update -STUBsize

dsmmigfs Update -PREViewsize
```

The value for the `STUBsize` is a multiple of the IBM Spectrum Scale file system’s block size. This value can be obtained by running the `mmlsfs <filesystem>`. The `PREViewsize` parameter must be equal to or less than the `STUBsize` value. Both parameters take a positive integer in bytes.

Example 6-78 shows how to set both the `STUBsize` and `PREViewsize` on the IBM Spectrum Scale file system.

```
Example 6-78   Updating STUBsize and PREViewsize

[root@kyoto prod]# dsmmigfs Update -STUBsize=3145728 -PREViewsize=1048576

/ibm/gpfs
IBM Spectrum Protect
Command Line Space Management Client Interface
  Client Version 8, Release 1, Level 6.0
  Client date/time: 01/11/2019 12:42:20

ANS90681 dsmmigfs: dsmmigfstab file updated for file system /ibm/gpfs.
```

For more information about the `dsmmigfs update` command, see IBM Knowledge Center.
6.15 Recalling files to their resident state

This section describes the **eeadm recall** command using the **--resident** option. However, this command should rarely be used. The **eeadm recall --resident** command is used to repair a file or object by changing the state to **Resident** when the tape (or tapes) that are used for migration, premigration, or save are not available.

The **eeadm recall --resident** command will recall the files back initially if the files are migrated then mark the files resident and remove the link between disk and tape. If the files are already premigrated the recall operation will be skipped and will just mark the files resident. This option removes metadata on IBM Spectrum Scale, which is used for keeping the file/object state.

A typical usage of the **eeadm recall --resident** command is a user accidentally migrates/premigrates one or more files to the wrong tape or has forgotten to make a copy.

Example 6-79 shows the output of making a file resident.

```
Example 6-79     Making a migrated file resident again
[root@kyoto prod]# eeadm file state file1
Name: /ibm/gpfs/prod/file1
State: migrated
ID: 607988035483409386-14551349586182802185-2117964496-1375543-0
Replicas: 1
Tape 1: 2MA132L5@pool2@libb (tape state=appendable)

[root@kyoto prod]# eeadm recall mig --resident
2019-01-11 12:49:25 GLESL268I: 1 file name(s) have been provided to recall.
2019-01-11 12:49:26 GLESL700I: Task selective_recall was created successfully, task id is 18904.
2019-01-11 12:49:32 GLESM750I: All 1 files were successfully changed to a resident state.

[root@kyoto prod]# eeadm file state file1
Name: /ibm/gpfs/prod/file1
State: resident
```

6.16 Reconciliation

This section describes file reconciliation with IBM Spectrum Archive EE and presents considerations for the reconciliation process.

HSM is not notified upon moves, renames, or deletions of files in IBM Spectrum Scale. Therefore, over time the metadata of migrated files on IBM Spectrum Scale can diverge from their equivalents on LTFS. The goal of the reconciliation function is to synchronize the IBM Spectrum Scale namespace with the corresponding LTFS namespace (per tape cartridge) and the corresponding LTFS attributes (per tape cartridge).
The reconciliation process resolves any inconsistencies that develop between files in the IBM Spectrum Scale and their equivalents in IBM Spectrum Archive EE. When files are deleted, moved, or renamed in IBM Spectrum Scale, the metadata of those files becomes out of sync with their copies in LTFS.

By performing file reconciliation, it is possible to synchronize the IBM Spectrum Scale namespace and attributes that are stored in LTFS (on tape cartridges) with the current IBM Spectrum Scale namespace and attributes. However, reconciliation works on only tape cartridges that were used in IBM Spectrum Archive EE. Tapes that were not used in LTFS Library Edition (LE) cannot be reconciled.

For each file that was deleted in IBM Spectrum Scale, the reconciliation process deletes the corresponding LTFS files and symbolic links. If the parent directory of the deleted symbolic link is empty, the parent directory is also deleted. This process frees memory resources that were needed for storing the LTFS index entries of those deleted files.

For each IBM Spectrum Scale file that was moved or renamed in IBM Spectrum Scale, the reconciliation process updates for each LTFS instance (replica) of that IBM Spectrum Scale file the LTFS extended attribute that contains the IBM Spectrum Scale path and the LTFS symbolic link.

Reconciliation can be performed on one or more GPFS file systems, one or more tape cartridge pools, or a set of tape cartridges. When the reconciliation process involves multiple tape cartridges, multiple IBM Spectrum Archive EE nodes and tape drives can be used in parallel. However, because recall tasks have priority, only available tape drives are used for reconciliation. After reconciliation is started, the tape cartridge cannot be unmounted until the process completes.

The synchronization and update to the IBM Spectrum Archive EE tapes can be time consuming and normally only required before any `eadm tape export` command. Normally if files are deleted from the IBM Spectrum Scale file systems, merely the update for the amount of reclaimable space is sufficient information. In other words, as files are deleted, administrators only want to know how much space can be reclaimed. Thus starting with v1.3.0.0, the default for `eadm tape reconcile` is to only update internal metadata information in order to correctly reflect the `Reclaimable%` column of the `eadm tape list` command. In order to update the tape (like previous to v1.3.0.0), the `--commit-to-tape` option should be supplied as part of the `eadm tape reconcile` command.

The following list presents limitations of the reconciliation process:

1. Only one reconciliation process can be started at a time. If an attempt is made to start a reconciliation process while another process is running, the attempt fails. The `eadm tape reconcile` command fails and the following failure message appears:

   GLESL098E: The same type of task or conflicting task was previously requested and it is running. Wait for completion of the task and try again.

2. After a reconciliation process is started, new migration tasks are prevented until the reconciliation process completes on the reconciling tapes. However, if any migration tasks are running, the reconciliation process does not begin until all migration tasks complete.

3. Recalls from a tape cartridge being reconciled are not available while the reconciliation process is updating the index for that tape cartridge, which is a short step in the overall reconciliation process.
The command outputs in the following examples show the effect that reconciliation has on the Reclaimable% column after that file is deleted from the IBM Spectrum Scale file system. Example 6-80 shows the initial file state of a single file on tape.

Example 6-80   Display the file state of a migrated file

```
[root@ueno ~]# eeadm file state
/gpfs/gpfs0/cmt/md1/files/LTFS_EE_FILE_mQH4oCZXQZKSXc6cYZjAuXPaFq56QBWJmY66PcuVnA
IW6B8Kr_K_gzCwGJ.bin
Name: /gpfs/gpfs0/cmt/md1/files/LTFS_EE_FILE_mQH4oCZXQZKSXc6cYZjAuXPaFq56QBWJmY66PcuVnA
IW6B8Kr_K_gzCwGJ.bin
State: premigrated
ID: 9226311045824247518-17452468188422870573-2026950408-6649759-0
Replicas: 3
Tape 1: P1B064JE@ueno@perf_lib (tape state=appendable)
Tape 2: P1B076JE@kanda@perf_lib (tape state=appendable)
Tape 3: P1B073JE@shimbashi@perf_lib (tape state=appendable)
```

The file is also present on the IBM Spectrum Scale file system, as shown in Example 6-81.

Example 6-81   List the file on the IBM Spectrum Scale file system

```
[root@ueno ~]# ls -hl
/gpfs/gpfs0/cmt/md1/files/LTFS_EE_FILE_mQH4oCZXQZKSXc6cYZjAuXPaFq56QBWJmY66PcuVnA
IW6B8Kr_K_gzCwGJ.bin
-rw------- 1 root root 1.8G Nov 12 15:29
```

IBM Spectrum Archive EE has the reclaimable space information from eeadm tape list for these tapes (see Example 6-82).

Example 6-82   Tape list in IBM Spectrum Archive EE

```
[root@ueno ~]# eeadm tape list | egrep "Tape|P1B064JE|P1B076JE|P1B073JE"
Tape ID   Status    State            Usable(GiB)  Used(GiB)  Available(GiB)  Reclaimable%  Pool       Library   Location  Task ID
P1B073JE  ok        appendable             18147      18137               9 0%  shimbashi perf_lib homeslot -
P1B064JE  ok        appendable             18147      18134              12 0%  ueno       perf_lib drive -
P1B076JE  ok        appendable             18147      18140               6 0%  kanda       perf_lib homeslot -
```

If you perform a reconciliation of the tape now using the default settings, IBM Spectrum Archive EE only updates the amount of reclaimable space on the tape within the internal metadata structure, as shown in Example 6-83.

Example 6-83   Reconcile the tape

```
[root@ueno ~]# eeadm tape reconcile P1B064JE -p ueno
2018-12-07 12:31:21 GLESL700I: Task reconcile was created successfully, task id is 5585.
```
If you now list the tapes with `eadm tape list`, you may see that the reclaimable space percentage be increased due to the deleted files (because it is in percentage and not in GBs, the size of deletion need to be large to see a percentage change).

### 6.17 Reclamation

The space on tape that is occupied by deleted files is not reused during normal IBM Spectrum Archive EE operations. New data is always written after the last index on tape. The process of reclamation is similar to the same named process in IBM Spectrum Protect (formerly Tivoli Storage Manager) environment because all active files are consolidated onto a new, empty, second tape cartridge. This process improves overall tape usage and utilization.

When files are deleted, overwritten, or edited on IBM Spectrum Archive EE tape cartridges, it is possible to reclaim the space. The reclamation function of IBM Spectrum Archive EE frees tape space that is occupied by non-referenced files and non-referenced content that is present on the tape. The reclamation process copies the files that are referenced by the LTFS index of the tape cartridge being reclaimed to another tape cartridge, updates the GPFS/IBM Spectrum Scale inode information, and then reformats the tape cartridge that is being reclaimed.

#### 6.17.1 Reclamation considerations

The following considerations should be reviewed before the reclamation function is used:

- **Reconcile before reclaiming tape cartridges**

  It is preferable to perform a reconciliation of the set of tape cartridges that are being reclaimed before the reclamation process is initiated. For more information, see 6.16, “Reconciliation” on page 171. If this is not performed, the reclamation might fail with the following message:
GLESL086I(01990): Reclamation has not completed since at least tape 058AGWL5 needs to be reconciled.

- **Scheduled reclamation**

It is preferable to schedule periodically reclamation for the IBM Spectrum Archive EE tape cartridge pools.

- **Recall priority**

Recalls are prioritized over reclamation. If there is a recall request for a file on a tape cartridge that is being reclaimed or for a file on the tape cartridge being used as the reclamation target, the reclamation task is stopped for the recall. After the recall is complete, the reclamation resumes automatically.

- **One tape cartridge at a time**

Only one tape cartridge is reclaimed at a time. The reclamation function does not support parallel use of drives for reclaiming multiple tape cartridges simultaneously.

Use the `eeadm tape reclaim` command to start reclamation of a specified tape cartridge pool or of certain tape cartridges within a specified tape cartridge pool. The `eeadm tape reclaim` command is also used to specify thresholds that indicate when reclamation is performed by the percentage of the available capacity on a tape cartridge.

Example 6-84 shows the results of reclaiming a single tape cartridge 058AGWL5.

```
Example 6-84  Reclamation of a single tape cartridge

[root@saitama2 prod]# eeadm tape reclaim JCB610JC -p pool1 -l lib_saitama
2019-01-10 09:15:08 GLESL700I: Task reclaim was created successfully, task id is 7115.
2019-01-10 09:15:08 GLESL084I: Start reclaiming 1 tapes in the following list of tapes:
2019-01-10 09:15:08 GLESR107I: Source candidates: JCB610JC.
2019-01-10 09:15:08 GLESR107I: Files in tape JCB610JC are copied to tape JCB141JC.
2019-01-10 09:20:30 GLESL081I: Tape JCB610JC successfully reclaimed, formatted, and unassigned from tape pool pool1.
2019-01-10 09:20:30 GLESL080I: Reclamation complete. 1 tapes reclaimed, 1 tapes unassigned from the tape pool.
```

At the end of the process, the tape cartridge is reformatted. The tape remains in the tape cartridge pool unless the “--unassign” option is specified. For more information, see, “The `eeadm <resource type> --help command” on page 282.

### 6.18 Checking and repairing tapes

There are three tape states that can occur on a tape which helps inform the user to perform a check. Once the root cause of the status is determined use the `eeadm tape validate` command to perform a check on the tapes and update the state back to `appendable`. All three states will prevent further migration and recall tasks to those tapes effected, therefore it is important to resolve the issues found and clear the states. The following are the check tape states:

- **check_tape_library**

  tapes fall into this state when they fail to get mounted to a drive, or is stuck in a drive and failed to get unmounted.
> **require_validate**

tapes fall into this state when the system detects some metadata mismatches on the tape.

> **check_key_server**

tapes fall into this state when there is a single tape that failed a write or read requiring an encryption key from an encryption key server.

Example 6-85 shows a tape in the **check_key_server** state and using the **eeadm tape validate** command to restore its state back to appendable after fixing the encryption key server.

**Example 6-85  Restoring a check_key_server tape back to appendable**

```
[root@saitama2 ~]# eeadm tape list -l lib_mikasa
Tape ID   Status  State             Usable(GiB)  Used(GiB)  Available(GiB) Reclaimable%  Pool   Library     Location  Task ID
MB0021JM  error   check_key_server            0          0               0 0%  pool2  lib_mikasa  homeslot  -

[root@saitama2 ~]# eeadm tape validate MB0021JM -p pool2 -l lib_mikasa
2019-01-10 11:27:24 GLESL700I: Task tape_validate was created successfully, task id is 7125.

[root@saitama2 ~]# eeadm tape list -l lib_mikasa
Tape ID   Status  State             Usable(GiB)  Used(GiB)  Available(GiB) Reclaimable%  Pool   Library     Location  Task ID
MB0021JM  info    full                     4536       4536               0 0%  pool2  lib_mikasa  homeslot  -
```

Two other tape states exist that require the user to replace the tapes. These two states occur when a tape encounters a read or write failure, and can be remedied by using the **eeadm tape replace** command. This command moves the data off the bad tape and onto an appendable tape within the same pool maintaining the migration order and finally removing the bad tape from the pool. The following are the two replacement tape states:

> **need_replace**

The IBM Spectrum Archive EE system detected one or more permanent read errors on this tape

> **require_replace**

The IBM Spectrum Archive EE system detected a permanent write error on the tape.

Example 6-86 shows the output of running the **eeadm tape replace** command

**Example 6-86  eeadm tape replace**

```
[root@mikasa1 prod]# eeadm tape replace JCB206JC -p test -l lib_mikasa
2018-10-09 10:51:58 GLESL700I: Task tape_replace was queued successfully, task id is 27382.
2018-10-09 10:51:58 GLESL755I: Kick reconcile before replace against 1 tapes.
2018-10-09 10:52:58 GLESSL756I: Reconcile before replace was finished.
2018-10-09 10:52:58 GLESSL753I: Starting tape replace for JCB206JC.
2018-10-09 10:55:05 GLESSL749I: Tape replace for JCB206JC is successfully done.
```
For more information about the various tape cartridge states, see 10.1.4, “Tape status codes” on page 285.

6.19 Importing and exporting

The import and export processes are the mechanisms for moving existing data on the LTFS written tape cartridges into or out of the IBM Spectrum Archive EE environment.

6.19.1 Importing

Import tape cartridges to your IBM Spectrum Archive EE system by running the eeadm tape import <list_of_tapes> -p <pool> [-l <library>] [OPTIONS] command.

When you import a tape cartridge, the eeadm tape import command performs the following actions:
1. Adds the specified tape cartridge to the IBM Spectrum Archive EE library
2. Assigns the tape to the designated pool
3. Adds the file stubs in an import directory within the IBM Spectrum Scale file system

Example 6-87 shows the import of an LTFS tape cartridge that was created on a different LTFS system into a directory that is called FC0257L8 in the /ibm/gpfs file system.

Example 6-87   Import an LTFS tape cartridge

```
[root@ginza ~] eeadm tape import FC0257L8 -p pool1 -P /ibm/gpfs/
2019-02-26 09:52:15 GLESL700I: Task import was created successfully, task id is 2432
2019-02-26 09:54:33 GLESL064I: Import of tape FC0257L8 complete.
```

Importing file paths

The default import file path for the eeadm tape import command is /{GPFS file system}/IMPORT. As shown in Example 6-88, if no other parameters are specified on the command line, all files are restored to the ../IMPORT/{VOLSER} directory under the GPFS file system.

Example 6-88   Import by using default parameters

```
[root@saitama2 ~]# eadm tape import JCB610JC -p test3 -l lib_saitama
2019-01-10 13:33:12 GLESL700I: Task import was created successfully, task id is 7132.

[root@saitama2 ~]# ls -las /ibm/gpfs/IMPORT/JCB610JC/
```

Example 6-89 on page 178 shows the use of the -P parameter, which can be used to redirect the imported files to an alternative directory. The VOLSER is still used in the directory name, but you can now specify a custom import file path by using the -P option. If the specified path does not exist, it is created.
Example 6-89 Import by using the -P parameter

```
[root@saitama2 gpfstest]# eeadm tape import JCB610JC -p test3 -l lib_saitama -P
/ibm/gpfs/alternate
2019-01-10 14:20:54 GLESL700I: Task import was created successfully, task id is 7139.
[root@saitama2 gpfstest]# ls /ibm/gpfs/alternate/JCB610JC
```

With each of these parameters, you have the option of renaming imported files by using the --rename parameters. This option will only rename any imported files with conflicting names by appending the suffix “_i” where i is a number from 1 to n.

### Importing offline tape cartridges

For more information about offline tape cartridges, see 6.19.2, “Exporting tape cartridges” on page 178. Offline tape cartridges can be reimported to the IBM Spectrum Scale namespace by running the `eeadm tape online` command.

When the tape cartridge is offline and outside the library, the IBM Spectrum Scale offline files on disk or the files on tape cartridge should not be modified.

Example 6-90 shows an example of making an offline tape cartridge online.

**Example 6-90 Online an offline tape cartridge**

```
[root@saitama2 ~]# eeadm tape online JCB610JC -p test3 -l lib_saitama
2019-01-10 14:42:36 GLESL700I: Task import was created successfully, task id is 7143.
```

### 6.19.2 Exporting tape cartridges

Export tape cartridges from your IBM Spectrum Archive EE system by running the `eeadm tape export` command. When you export a tape cartridge, the process removes the tape cartridge from the IBM Spectrum Archive EE library. The tape cartridge is reserved so that it is no longer a target for file migrations. It is then reconciled to remove any inconsistencies between it and IBM Spectrum Scale.

The export process then removes all files from the IBM Spectrum Scale file system that exist on the exported tape cartridge. The files on the tape cartridges are unchanged by the export, and are accessible by other LTFS systems.

**Export considerations**

Consider the following information when planning IBM Spectrum Archive EE export activities:

- If you put different logical parts of an IBM Spectrum Scale namespace (such as the project directory) into different LTFS tape cartridge pools, you can export tape cartridges that contain the entire IBM Spectrum Scale namespace or only the files from a specific directory within the namespace.

  Otherwise, you must first recall all the files from the namespace of interest (such as the project directory), then migrate the recalled files to an empty tape cartridge pool, and then export that tape cartridge pool.

- Reconcile occurs automatically before the export is processed.
Although the practice is not preferable, tape cartridges can be physically removed from IBM Spectrum Archive EE without exporting them. In this case, no changes are made to the IBM Spectrum Scale inode. The following results can occur:

- Causes a file operation that requires access to the removed tape cartridge to fail. No information as to where the tape cartridges are is available.
- Files on an LTFS tape cartridge can be replaced in IBM Spectrum Archive EE without reimporting (that is, without updating anything in IBM Spectrum Scale). This process is equivalent to a library going offline and then being brought back online without taking any action in the IBM Spectrum Scale namespace or management.

**Important**: If a tape cartridge is removed from the library without the use of the export utility, modified, and then reinserted in the library, the behavior can be unpredictable.

### Exporting tape cartridges

The normal export of an IBM Spectrum Archive EE tape cartridge first reconciles the tape cartridge to correct any inconsistencies between it and IBM Spectrum Scale. Then, it removes all files from the IBM Spectrum Scale file system that exist on the exported tape cartridge.

Example 6-91 shows the typical output from the `export` command.

**Example 6-91** Export a tape cartridge

```bash
[root@saitama2 ~]# eeadm tape export JCB610JC -p test3 -l lib_saitama --remove
2019-01-10 12:52:23 GLESL700I: Task export_remove was created successfully, task id is 7127.
2019-01-10 12:52:23 GLESL719I: Reconcile as a part of an export is starting.
2019-01-10 13:29:59 GLESSL086I: Reconcile is skipped for tape JCB610JC because it is already reconciled.
2019-01-10 13:30:01 GLESL632I: Reconcile as a part of an export finishes
2019-01-10 13:30:01 GLESSL073I: Remove export of tape JCB610JC has been requested.
2019-01-10 13:31:03 GLESSL762I: Tape JCB610JC was forcefully unassigned from pool test3 during an export operation. Files on the tape cannot be recalled. Run the "eeadm tape import" command for the tape to recall the files again.
```

Example 6-92 on page 180 shows how the normal exported tape is displayed as exported by running the `eeadm info tapes` command.
Example 6-92   Display status of normal export tape cartridge

# eeadm tape list

<table>
<thead>
<tr>
<th>Tape ID</th>

<td>0%</td>
<td>-</td>
<td>liba</td>
<td>homeslot</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

If errors occur during the export phase, the tape goes to the export state. However, some of the files that belong to that tape might still remain in the file system and still have a reference to that tape. Such an error can occur when an export is happening and while reconciliation occurs one starts to modify the files belonging to the exporting tape. In such a scenario, see 9.5, “Software” on page 269 on how to clean up the remaining files on the IBM Spectrum Scale file system.

Regarding full replica support, Export/Import does not depend on the primary/redundant copy. When all copies are exported, the file is exported.

Table 6-1 lists a use case example where a file was migrated to three physical tapes: TAPE1, TAPE2, TAPE3. The file behaves as shown by export operations.

Table 6-1   Export operations use case scenario of file with three tapes

<table>
<thead>
<tr>

<td>File is available (IBMTPS has TAPE3).</td>
</tr>
<tr>
<td>TAPE1/TAPE2/TAPE3 is exported.</td>
<td>File is removed from GPFS.</td>
</tr>
</tbody>
</table>

6.19.3 Offlining tape cartridges

Offline tape cartridges from your IBM Spectrum Archive EE system by running the eeadm tape offline command. This process marks all files from the tape cartridges or tape cartridge pool that are specified and marks them offline and those files cannot be accessed. However, the corresponding inode of each file is kept in IBM Spectrum Scale. Those files can be brought back to the IBM Spectrum Scale namespace by making online the tape cartridge by using the eeadm tape online command.

If you want to move tape cartridges to an off-site location for DR purposes but still retain files in the IBM Spectrum Scale file system, follow the procedure that is described here. In Example 6-93, tape JCB610JC contains redundant copies of five MPEG files that must be moved off-site.

Example 6-93   Offlining a tape cartridge

```
[root@saitama2 ~]# eeadm tape offline JCB610JC -p test3 -l lib_saitama -o "Moved to storage room B"
2019-01-10 14:39:55 GLESL700I: Task tape_offline was created successfully, task id is 7141.
2019-01-10 14:39:55 GLESL073I: Offline export of tape JCB610JC has been requested.
```
If you run the `eedm info tapes` command, you can see the offline status of the tape cartridge, as shown in Example 6-94.

**Example 6-94 Display status of offline tape cartridges**

```
[root@saitama2 ~]# eeadm tape list -l lib_saitama
Tape ID   Status  State          Usable(GiB)  Used(GiB)  Available(GiB)  Reclaimable%  Pool   Library      Location  Task ID
JCA561JC  ok      offline                  0          0               0            0%  pool2  lib_saitama  homeslot  -
JCA224JC  ok      appendable            6292          0            6292            0%  pool1  lib_saitama  homeslot  -
JCC093JC  ok      appendable            6292        496            5796            0%  pool1  lib_saitama  homeslot  -
JCB745JC  ok      append_fenced         6292          0               0            0%  pool2  lib_saitama  homeslot  -
```

It is now possible to physically remove tape JCA561JC from the tape library so that it can be sent to the off-site storage location.

Regarding full replica support, Offlining/Onlining does not depend on the primary/redundant copy. When all copies are offline, the file is offline.

Table 6-2 lists a use case example where a file was migrated to three physical tapes: TAPE1, TAPE2, TAPE3. The file behaves as shown by offline operations.

**Table 6-2 Export operations use case scenario of file with three tapes**

<table>
<thead>
<tr>
<th>Operation</th>
<th>File</th>
</tr>
</thead>
<tbody>
<tr>
<td>TAPE1 is offline.</td>
<td>File is available (can recall).</td>
</tr>
<tr>
<td>TAPE1/TAPE2 are offline.</td>
<td>File is available (can recall).</td>
</tr>
<tr>
<td>TAPE1/TAPE2/TAPE3 are offline.</td>
<td>File is offline (cannot recall).</td>
</tr>
<tr>
<td>TAPE1/TAPE2 are offline exported, and then TAPE3 is exported.</td>
<td>File is offline (IBMTPS has TAPE1/TAPE2).</td>
</tr>
</tbody>
</table>

Example 6-95 shows the file state when the tape host has been offline.

**Example 6-95 Offline file state**

```
[root@saitama2 prod]# eeadm file state *.bin
Name: /ibm/gpfs/prod/file1
State: migrated (check tape state)
ID: 11151648183451819981-3451383879228984073-1435527450-974349-0
Replicas: 1
Tape 1: JCB610JC@test3@lib_saitama (tape state=offline)
```

### 6.20 Drive Role settings for task assignment control

IBM Spectrum Archive EE allows users to configure their drives to allow or disallow specific tasks. Each of the attributes corresponds to the tape drive’s capability to perform a specific type of task. Here are the attributes:

- Migration
- Recall
- Generic
Table 6-3 lists the available IBM Spectrum Archive EE drive attributes for the attached physical tape drives.

Table 6-3 IBM Spectrum Archive EE drive attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Migration</td>
<td>If the Migration attribute is set for a drive, that drive can process migration tasks. If not, IBM Spectrum Archive EE never runs migration tasks by using that drive. Save tasks are also allowed/disallowed through this attribute setting. It is preferable that there be at least one tape drive that has this attribute set to Migration.</td>
</tr>
<tr>
<td>Recall</td>
<td>If the Recall attribute is set for a drive, that drive can process recall tasks. If not, IBM Spectrum Archive EE never runs recall tasks by using that drive. Both automatic file recall and selective file recall are enabled/disabled by using this single attribute. There is no way to enable/disable one of these two recall types selectively. It is preferable that there be at least one tape drive that has this attribute set to Recall.</td>
</tr>
<tr>
<td>Generic</td>
<td>If the Generic attribute is set for a drive, that drive can process generic tasks. If not, IBM Spectrum Archive EE never runs generic tasks by using that drive. IBM Spectrum Archive EE creates and runs miscellaneous generic tasks for administrative purposes, such as formatting tape, checking tape, reconciling tape, reclaiming a tape, and validating a tape. Some of those tasks are internally run with any of the user operations. It is preferable that there be at least one tape drive that has this attribute set to Generic. For reclaiming tape, at least two tape drives are required, so at least two drives need the Generic attribute.</td>
</tr>
</tbody>
</table>

To set these attributes for a tape drive, the attributes can be specified when adding a tape drive to IBM Spectrum Archive EE. Use the following command syntax:

```
etadm drive assign <drive serial> -n <node_id> -r
```

The -r option requires a decimal numeric parameter. A logical OR applies to set the three attributes: Migration (4), Recall (2), and Generic (1). For example, a number of 6 for -r allows migration and recall task while copy and generic task are disallowed. All of the attributes are set by default.

To check the current active drive attributes, the `etteadm drive list` command is useful. This command shows each tape drive’s attributes, as shown in Example 6-96.

Example 6-96 Check current IBM Spectrum Archive EE drive attributes

```
[root@saitama2 prod]# etadm drive list -l lib_saitama
Drive S/N     State        Type    Role  Library      Node ID  Tape      Node Group  Task
ID
0000078PG24E  mounted      TS1160   mrg  lib_saitama  6        JD0321JD  G0          -
0000078PG20E  not_mounted  TS1160   mrg  lib_saitama  2        -         G0          -
0000078D9DBA  not_mounted  TS1155   mrg  lib_saitama  2        -         G0          -
0000000A246   not_mounted  TS1155   mrg  lib_saitama  2        -         G0          -
0000078PG24A  not_mounted  TS1160   mrg  lib_saitama  6        -         G0          -
0000078D82F4  unassigned   -        ---  lib_saitama  -        -         -           -
```

The letters m, r, and g are shown when the corresponding attribute Migration, Recall, and Generic are set to on. If an attribute is not set, “-” is shown instead.
The role of an assigned drive can be modified by using the `eeadm drive set` command. For example, the following command changes the role to Migrate and Recall.

```
eeadm drive set <drive serial> -a role -v mr
```

The configuration change takes effect after the on-going process has completed.

**Drive attributes setting hint:** In a multiple nodes environment, it is expected that the reclaim driver works faster if two tape drives that are used for reclaim are assigned to a single node. For that purpose, tape drives with the `Generic` attribute should be assigned to a single node and all of other drives of the remaining nodes should not have the `Generic` attribute.

### 6.21 Tape drive intermix support

This section describes the physical tape drive intermix support

This enhancement has these objectives:

- Use IBM LTO-8 tapes and drives in mixed configuration with older IBM LTO (LTO-8, 7, 6, and 5) generations
- Use 3592 JC/JD cartridges along with IBM TS1160, TS1155, TS1150, and TS1140 drives in mixed environments

**Note:** An intermix of LTO and TS11xx tape drive technology and media is not supported by IBM Spectrum Archive EE.

The following main use cases are expected to be used by this feature:

- Tape media and technology migration (from old to new generation tapes)
- Continue using prior generation formatted tapes (read or write) with the current technology tape drive generation

To generate and use a mixed tape drive environment, you must define the different LTO or TS11xx drive types with the creation of the logical library partition (within your tape library) to be used along with your IBM Spectrum Archive EE setup.

When LTO-8, 7, 6, and 5 tapes are used in a tape library, correct cartridges and drives are selected by IBM Spectrum Archive EE to read or write the required data, which includes the usage of an LTO8 drive for recall from LTO6 tapes.

When 3592 JC or 3592 JD tapes are used in a tape library and IBM TS1160, TS1155, TS1150, and TS1140 drives are used correct tapes and drives are selected by IBM Spectrum Archive EE to read or write the required data.

With this function, a data migration between different generations of tape cartridges can be achieved. You can select and configure which TS11xx format (TS1155, TS1150, or TS1140) is used by IBM Spectrum Archive EE for operating 3592 JC tapes. The default for IBM Spectrum Archive EE is always to use and format to the highest available capacity. The TS1160 supports only recalls of JC media formatted using TS1140.

The `eeadm tape assign` command can be used for configuration when new physical tape cartridges are added to your IBM Spectrum Archive EE setup.

```
eeadm tape assign <list_of_tapes> -p <pool> [-I <library>] [OPTIONS]
```
WORM support for the IBM TS1160, TS1155, TS1150, and TS1140 tape drives

From the long-term archive perspective, there is sometimes a requirement to store files without any modification that is ensured by the system. You can deploy Write Once Read Many (WORM) tape cartridges in your IBM Spectrum Archive EE setup. Only 3592 WORM tapes that can be used with IBM TS1160, TS1155, TS1150, or TS1140 drives are supported.

**Note:** LTO WORM tapes are not supported for IBM Spectrum Archive EE.

For more information about IBM tape media and WORM tapes, see this website.

### 6.21.1 Objective for WORM tape support

The IBM Spectrum Archive EE objective for WORM tapes is to store files without any modifications, which is ensured by the system, but with the following limitations:

- Only ensure that the file on tape is immutable if the user uses only IBM Spectrum Archive EE:
  - Does not detect the case where an appended modified index is at the end of tape by using a direct SCSI command.
  - From LTFS format perspective, this case can be detected but it needs time to scan every index on the tape. This feature is not provided in the release of IBM Spectrum Archive EE on which this book is based.
- Does not ensure that the file cannot be modified through GPFS in the following ways:
  - Migrate the immutable files to tape.
  - Recall the immutable files to disk.
  - Change the immutable attribute of the file on disk and modify.

### 6.21.2 Function overview for WORM tape support

The following features are present to support 3592 WORM tapes:

- WORM attribute to the IBM Spectrum Archive EE pool attributes.
- A WORM pool can have only WORM cartridges.
- Files that have GPFS immutable attributes can still be migrated to normal pools.

Example 6-97 shows how to set the WORM attribute to an IBM Spectrum Archive EE pool by using the `eeadm pool create` command.

**Example 6-97  Set the WORM attribute to an IBM Spectrum Archive EE pool**

```bash
[root@saitama2 prod]# eeadm pool create myWORM --worm physical
```

There is also an IBM Spectrum Scale layer that can provide a certain immutability for files within the GPFS file system. You can apply immutable and appendonly restrictions either to individual files within a file set or to a directory. An immutable file cannot be changed or renamed. An appendonly file allows append operations, but not delete, modify, or rename operations.
An immutable directory cannot be deleted or renamed, and files cannot be added or deleted under such a directory. An appendOnly directory allows new files or subdirectories to be created with 0-byte length. All such new created files and subdirectories are marked as appendOnly automatically.

The immutable flag and the appendOnly flag can be set independently. If both immutability and appendOnly are set on a file, immutability restrictions are in effect.

To set or unset these attributes, use the following IBM Spectrum Scale command options:

- **mmchattr -i yes|no**
  - This command sets or unsets a file to or from an immutable state:
    - `-i yes`
      - Sets the immutable attribute of the file to yes.
    - `-i no`
      - Sets the immutable attribute of the file to no.

- **mmchattr -a yes|no**
  - This command sets or unsets a file to or from an appendOnly state:
    - `-a yes`
      - Sets the appendOnly attribute of the file to yes.
    - `-a no`
      - Sets the appendOnly attribute of the file to no.

**Note:** Before an immutable or appendOnly file can be deleted, you must change it to mutable or set appendOnly to no (by using the `mmchattr` command).

Storage pool assignment of an immutable or appendOnly file can be changed. An immutable or appendOnly file is allowed to transfer from one storage pool to another.

To display whether a file is immutable or appendOnly, run this command:

```
mmlsattr -L myfile
```

The system displays information similar to the output that is shown in Example 6-98.

**Example 6-98 Output of the mmlsattr -L myfile command**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
6.21.3 The effects of file operations on immutable and appendOnly files

After a file is set as immutable or appendOnly, the following file operations and attributes work differently from the way they work on regular files:

- **delete**
  
  An immutable or appendOnly file cannot be deleted.

- **modify/append**
  
  An immutable file cannot be modified or appended. An appendOnly file cannot be modified, but it can be appended.

  **Note:** The immutable and appendOnly flag check takes effect after the file is closed. Therefore, the file can be modified if it is opened before the file is changed to immutable.

- **mode**
  
  An immutable or appendOnly file's mode cannot be changed.

- **ownership, acl**
  
  These attributes cannot be changed for an immutable or appendOnly file.

- **extended attributes**
  
  These attributes cannot be added, deleted, or modified for an immutable or appendOnly file.

- **timestamp**
  
  The time stamp of an immutable or appendOnly file can be changed.

- **directory**
  
  If a directory is marked as immutable, no files can be created, renamed, or deleted under that directory. However, a subdirectory under an immutable directory remains mutable unless it is explicitly changed by the mmlsattr command.

  If a directory is marked as appendOnly, no files can be renamed or deleted under that directory. However, 0-byte length files can be created.

For more information about IBM Spectrum Scale V5.0.2 immutable and appendOnly limitations, see IBM Knowledge Center.

Example 6-99 shows the output that you receive while working, showing, and changing the IBM Spectrum Scale immutable or appendOnly file attributes.

**Example 6-99  Set or change an IBM Spectrum Scale file immutable file attribute**

```
[root@ltfse_node0]# echo "Jan" > jan_jonas.out
[root@ltfse_node0]# mmlsattr -L -d jan_jonas.out
file name:                jan_jonas.out
metadata replication:    1 max 2
data replication:        1 max 2
immutable:               no
appendOnly:              no
flags:
storage pool name:       system
fileset name:             root
snapshot name:

  type: wrapped FEK  WrpPar 'AES:KWRAP'  CmbPar 'XORHMACSHA512'
  KEY-a65222ad-e8bc-4fcc-89a3-4a7c54d4181c:ltfssn2

[root@ltfsee_node0]# echo "Jonas" >> jan_jonas.out
-bash: jan_jonas.out: Read-only file system
[root@ltfsee_node0]#

These immutable or appendOnly file attributes can be changed at any time by the IBM Spectrum Scale administrator. They cannot provide an ultimate immutability.

If you are working with IBM Spectrum Archive EE and IBM Spectrum Scale and you plan implementing a WORM solution along with WORM tape cartridges, these two main assumptions apply:

- Only files that have IBM Spectrum Scale with the immutable attribute ensure no modification.
- The IBM Spectrum Scale immutable attribute is not changed after it is set unless it is changed by an administrator.

Consider the following limitations when using WORM tapes together with IBM Spectrum Archive EE:

- WORM tapes are supported only with IBM TS1160, TS1155, TS1150, and TS1140 tape drives (3592 JV, JY, JZ).
If IBM Spectrum Scale immutable attributes are changed after migration, the next migration fails against the same WORM pool.

IBM Spectrum Archive EE supports the following operations with WORM media:
- Migrate
- Recall
- Offline export and offline import

IBM Spectrum Archive EE does not support the following operations with WORM media:
- Reclaim
- Reconcile
- Export and Import

For more information about the IBM Spectrum Archive EE commands, see 10.1, “Command-line reference” on page 282.

6.22 Obtaining the location of files and data

This section describes how to obtain information about the location of files and data by using IBM Spectrum Archive EE.

You can use the `eeadm file state` command to discover the physical location of files. To help with the management of replicas, this command also indicates which tape cartridges are used by a particular file, how many replicas exist, and the health state of the tape.

Example 6-100 shows the typical output of the `eeadm file state` command. Some files are on multiple tape cartridges, some are in a migrated state, and others are premigrated only.

Example 6-100  Files location

```
[root@saitama2 prod]# eeadm file state *.bin
Name: /ibm/gpfs/prod/file1.bin
State: premigrated
ID: 11151648183451819981-3451383879228984073-1435527450-974349-0
Replicas: 2
Tape 1: JCB610JC@test3@lib_saitama (tape state=appendable)
Tape 2: JD0321JD@test4@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/file2.bin
State: migrated
ID: 11151648183451819981-3451383879228984073-2015134857-974348-0
Replicas: 2
Tape 1: JCB610JC@test3@lib_saitama (tape state=appendable)
Tape 2: JD0321JD@test4@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/file3.bin
State: migrated
ID: 11151648183451819981-3451383879228984073-2015134857-974348-0
Replicas: 2
Tape 1: JCB610JC@test3@lib_saitama (tape state=appendable)
Tape 2: JD0321JD@test4@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/file4.bin
State: migrated
ID: 11151648183451819981-3451383879228984073-2015134857-974348-0
Replicas: 2
Tape 1: JCB610JC@test3@lib_saitama (tape state=appendable)
Tape 2: JD0321JD@test4@lib_saitama (tape state=appendable)
```
6.23 Obtaining system resources, and tasks information

This section describes how to obtain resource inventory information and information about ongoing migration and recall tasks with IBM Spectrum Archive EE. You can use the `eeadm task list` command to obtain information about current tasks and the `eeadm task show` to see detailed information about the task. To view IBM Spectrum Archive EE system resources use any of the following commands:

- `eeadm tape list`
- `eeadm drive list`
- `eeadm pool list`
- `eeadm node list`
- `eeadm nodelist`

Example 6-101 shows the command that is used to display all IBM Spectrum Archive EE tape cartridge pools.

**Example 6-101  Tape cartridge pools**

```
[root@saitama2 prod]# eeadm pool list
Pool Name  Usable(TiB)  Used(TiB)  Available(TiB)  Reclaimable%  Tapes  Type
Library      Node Group
myWORM             0.0        0.0             0.0            0%      0  -
lib_saitama  G0
pool1             64.1        3.9            60.2            0%     10  3592
lib_saitama  G0
test2              6.1        0.0             6.1            0%      1  3592
lib_saitama  G0
```

Example 6-102 shows the serial numbers and status of the tape drives that are used by IBM Spectrum Archive EE.

**Example 6-102  Drives**

```
[root@saitama2 prod]# eeadm drive list
Drive S/N     State        Type    Role  Library      Node ID  Tape      Node Group  Task
ID
0000078PG24E  mounted      TS1160   mrg  lib_saitama  6        JD0321JD  G0          -
0000078PG20E  not_mounted  TS1160   mrg  lib_saitama  2        -         G0          -
0000078D9DBA  not_mounted  TS1155   mrg  lib_saitama  2        -         G0          -
```

**Note:** Migration of files with special characters in the file name or directory path name might succeed, but reconciliation and normal export will fail due to symlink creation failure.
To view all the IBM Spectrum Archive EE tape cartridges, run the command that is shown in Example 6-103.

### Example 6-103 Tape cartridges

<table>
<thead>
<tr>
<th>Tape ID</th>

</tr>
</tbody>
</table>

Regularly monitor the output of IBM Spectrum Archive EE tasks to ensure that tasks are progressing as expected by using the `eeadm task list` and `eeadm task show` command. Example 6-104 shows a list of active tasks.

### Example 6-104 Active tasks

<table>
<thead>
<tr>
<th>TaskID</th>
<th>Type</th>
<th>Priority</th>
<th>Status</th>
<th>#DRV</th>
<th>CreatedTime(-0700)</th>
<th>StartedTime(-0700)</th>
</tr>
</thead>
<tbody>
<tr>
<td>7168</td>
<td>selective_recall</td>
<td>H</td>
<td>running</td>
<td>0</td>
<td>2019-01-10_16:27:30</td>
<td>2019-01-10_16:27:30</td>
</tr>
<tr>
<td>7169</td>
<td>selective_recall</td>

<td>available</td>
<td>9.11.244.24</td>
<td>2</td>
<td>yes</td>
<td>lib_mikasa</td>
<td>G0</td>
<td>mikasa1</td>
</tr>
</tbody>
</table>

The `eeadm task show` command (see Example 6-106) provides a summary of the specified active task in IBM Spectrum Archive EE. The task id corresponds to the task id that is reported by the `eeadm task list` command.

### Example 6-106 Detailed outlook of recall task

```
[root@saitama2 prod]# eeadm task show 7168 -v

=== Task Information ===
Task ID:              7168
Task Type:            selective_recall
Command Parameters:   eeadm recall mig -l lib_saitama
Status:               running
Result:               -

Progress:             1 completed (or failed) files / 3 total files.
Result Summary:       -
Messages:             -
```
6.24 Monitoring the system with SNMP

You can use SNMP traps to receive notifications about system events. There are many processes that should be reported through SNMP. Starting with IBM Spectrum Archive EE v1.2.4.0, IBM Spectrum Archive EE uses SNMP to monitor the system and send alerts when the following events occur:

- IBM Spectrum Archive EE component errors are detected.
- Recovery actions are performed on failed components.
- At the end of an `eadm cluster start` and `eadm cluster stop` command, and at the successful or unsuccessful start or stop of each component of an IBM Spectrum Archive EE node.
- When the remaining space threshold for a pool is reached.

The MIB file is installed in `/opt/ibm/ltfsee/share/IBMSA-MIB.txt` on each node. It should be copied to the `/usr/share/snmp/mibs/` directory on each node.

Table 6-4 lists SNMP traps that can be issued, showing the error message that is generated, along with the trap name, severity code, and the OID for each trap.

<table>
<thead>
<tr>
<th>Description</th>
<th>Name</th>
<th>Severity</th>
<th>OID</th>
</tr>
</thead>
<tbody>

6.25 Configuring Net-SNMP

It is necessary to modify the `/etc/snmp/snmpd.conf` and `/etc/snmp/snmptrapd.conf` configuration file to receive SNMP traps. These files should be modified on each node that has IBM Spectrum Archive EE installed and running.

To configure Net-SNMP, complete the following steps on each IBM Spectrum Archive EE node:

1. Open the `/etc/snmp/snmpd.conf` configuration file.
2. Add the following entry to the file:
   ```
   master agentx
   trap2sink <managementhost>
   ```
   The variable `<managementhost>` is the host name or IP address of the host to which the SNMP traps are sent.
3. Open the `/etc/snmp/snmptrapd.conf` configuration file.
4. Add the following entry to the file:
   ```
   disableauthorization yes
   ```
5. Restart the SNMP daemon by running the following command:
   ```
   [root@ltfs97 ~]# systemctl restart snmpd.service
   ```

6.25.1 Starting and stopping the snmpd daemon

Before IBM Spectrum Archive EE is started, you must start the snmpd daemon on all nodes where IBM Spectrum Archive EE is running.

To start the snmpd daemon, run the following command:
```
[root@ltfs97 ~]# systemctl start snmpd.service
```

To stop the snmpd daemon, run the following command:
```
[root@ltfs97 ~]# systemctl stop snmpd.service
```

To restart the snmpd daemon, run the following command:
```
[root@ltfs97 ~]# systemctl restart snmpd.service
```
6.25.2 Example of an SNMP trap

Example 6-107 shows the type of trap information that is received by the SNMP server.

Example 6-107    SNMP trap example of an IBM Spectrum Archive EE node that has a low pool threshold

2018-11-26 09:08:42 tora.tuc.stglabs.ibm.com [UDP: [9.11.244.63]:60811->[9.11.244.63]:162]:

30(TiB)"

6.26 IBM Spectrum Archive REST API

The IBM Spectrum Archive EE REST API gives users another interface to interact with the IBM Spectrum Archive EE product. REST uses http GET operations to return status information about IBM Spectrum Archive EE. This section covers the GET operations for the IBM Spectrum Archive EE Rest API.

The IBM Spectrum Archive EE REST API can be accessed in two ways. The first is through a terminal window with the curl command and the second way is through a web browser. Both ways output the same data. In this section, the curl command is used.

The following are supported GET operations when executing rest commands:

- **pretty**
  
  Specify for pretty-printing. The default value is false.

- **sort: <string>(,<string>...)**
  
  Specify field name or names to use as sort key. The default sort order is ascending. Use the “-” sign to sort in descending order.

- **fields: <string>(,<string>...)**
  
  Specify field names that are to be included in the response.

**Note:** The examples in this section are all performed on the server with the REST RPM installed and uses localhost to request resources. When accessing the REST API over a remote server, replace localhost with the server ip with the rest rpms installed.

6.26.1 Pools endpoint

IBM Spectrum Archive EE rest pools endpoint returns all information in JSON objects about each pool created thus far within the environment.

The following is an example command of calling the pools endpoint using localhost:
curl -X GET ‘http://localhost:7100/ibmsa/v1/pools/’
The following is the response data returned when requesting for the pools endpoint:

- **id**: <string>
  UUID of Pool, assigned by system at the creation of pool.

- **name**: <string>
  User-specified name of pool.

- **capacity**: <number>
  Total capacity of tapes assigned to the pool, in bytes. The \( \text{capacity} = \text{used\_space} + \text{free\_space} \).

- **mode**: <string>
  The current operational mode of the pool. Access to the member tapes is temporarily disabled when this field is set to “disabled”, “relocation\_source”, or “relocation\_destination”. Under normal operating conditions, the field is set to “normal”. If an internal error occurs, the field is set to an empty string.

- **used\_space**: <number>
  Used space of the pool, in bytes. The \( \text{used\_space} = \text{active\_space} + \text{reclaimable\_space} \).

- **free\_space**: <number>
  Free space of the pool, in bytes.

- **active\_space**: <number>
  Active space (used space consumed by active-referred files) of the pool, in bytes.

- **reclaimable\_space**: <number>
  The reclaimable space (used space consumed by unreferred files) of the pool, in bytes. Note that this is the amount of estimated size of the unreferenced space that is available for reclamation on the assigned tapes.

- **non\_appendable\_space**: <number>
  The total capacity, in bytes, of tapes in the pool that cannot be written to in the format specified for the pool, and that don’t match the media\_restriction value for the pool. The format and the media\_restriction values are provided as attributes of the pool.

- **num\_of\_tapes**: <number>
  Number of tapes assigned to the pool.

- **format\_class**: <string>
  The format class of the pool.

- **media\_restriction**: <string>
  The media\_restriction setting is stored in the regular expression of the bar code value. The media\_restriction is used to define the type of cartridge that can be used for writing. The cartridge media type that is represented by the last two letters of the cartridge bar code is used in this field. The string can be either “\^.(6)XX$”, “\^.(8)$”, or “unknown”. The “\^.(6)XX$” represents any 6 characters followed by type “XX “, where “XX “ is one of the following cartridge media types: L5, L6, L7, L8, M8, JB, JC, JD, JK, JL, JY, or JZ. The “\^.(8)$” represents any 8 characters, and means that any cartridge media type is acceptable. A value of “unknown” means that there is an error condition.

- **device\_type**: <string>
  Tape device type that can be added to the pool. Can be either 3592, LTO, or left blank.

- **worm**: <string>
  WORM type. Can be either physical, logical, no, or unknown.
fill_policy: <string>
    Tape fill policy.

owner: <string>
    Owner.

mount_limit: <number>
    Maximum number of drives that can be used for migration. 0 means unlimited.

low_space_warning_enable: <bool>
    Whether monitoring thread sends SNMP trap for low space pool.

low_space_warning_threshold: <number>
    SNMP notification threshold value for free pool size in bytes. 0 when no threshold is set.

no_space_warning_enable: <bool>
    Whether monitoring thread sends SNMP trap for no space pool.

library_name: <string>
    Library name to which the pool belongs.

library_id: <string>
    Library ID (serial number) to which the pool belongs.

node_group: <string>
    Node group name to which the pool belongs.

The following parameters are available to be passed in to filter specific pools:

name: <string>
    Filter the list of pools by name. Only the pools that match the criteria are returned in the response.

library_name: <string>
    Filter the list of pools by library name. Only the pools that match the criteria are returned in the response.

Example 6-108 shows how to request the pools resource through curl commands.

Example 6-108    REST pool command

```
[root@tora ~]# curl -X GET 'http://localhost:7100/ibmsa/v1/pools?pretty=true'
```

```json
[
    {
        "active_space": 0,
        "capacity": 0,
        "device_type": "3592",
        "fill_policy": "Default",
        "format_class": "60F",
        "free_space": 0,
        "id": "f244d0eb-e70d-4a7f-9911-0e3e1bd12720",
        "library_id": "65a75bb5-8005-4197-b2a5-31c0d6f6e1c0",
        "library_name": "lib_tora",
        "low_space_warning_enable": false,
        "low_space_warning_threshold": 0,
        "media_restriction": "^[a-zA-Z0-9]*$",
        "mode": "normal",
        "mount_limit": 0,
    }
]
Example 6-109 shows how to call pools with specifying specific fields and sorting the output in descending order.

**Example 6-109  REST API pools endpoint**

```
[root@tora ~]# curl -X GET
'http://localhost:7100/ibmsa/v1/pools?pretty=true&fields=capacity,name,library_name,free_space,num_of_tapes,device_type&sort=-free_space'
```

```
[

  {
    "capacity": 0,

    "reclaimable_space": 0,
    "used_space": 0,
    "worm": "no"
  }
]
```
6.26.2 Tapes endpoint

The tapes endpoint returns an array of JSON objects regarding tape information. The following is an example command of calling tapes:

curl -X GET ‘http://localhost:7100/ibmsa/v1/tapes’

The following is the response data when requesting the tapes endpoint:

- **id**: <string>
  
  Tape ID. Because barcode is unique within a tape library only, the id is in format of <barcode>@<library_id>.

- **barcode**: <string>
  
  Barcode of the tape.

- **state**: <string>
  
  The string indicates the state of the tape. The string can be either “appendable”, “append_fenced”, “offline”, “recall_only”, “unassigned”, “exported”, “full”, “data_full”, “check_tape_library”, “need_replace”, “require_replace”, “require_validate”, “check_key_server”, “check_hba”, “inaccessible”, “non_supported”, “duplicated”, “missing”, “disconnected”, “unformatted”, “label_mismatch”, “need_unlock”, and “unexpected_cond”. If the string is “unexpected_cond”, it is probably an error occurred.

- **status**: <string>
  
  The string indicates the severity level of the tape’s status. The string can be either “critical”, “error”, “degraded”, “warning”, “info”, or “ok”.

- **media_type**: <string>
  
  Media type of a tape. Media type is set even if the tape is not assigned to any pool yet. Empty string if the tape is not supported by IBM Spectrum Archive.

- **media_generation**: <string>
  
  Media generation of a tape. Media generation determines a possible format that the tape can be written in.

- **format_density**: <string>
  
  Format of a tape. Empty string if the tape is not assigned to any pool.

- **worm**: <bool>
  
  Whether WORM is enabled for the tape.

- **capacity**: <number>
  
  Capacity of the tape, in bytes. capacity = used_space + free_space.
Appendable: <string>
A tape that can be written in the format that is specified by the pool attributes, and on the
cartridge media type that is specified by the pool attributes, is appendable. The format and
the cartridge media type are provided as attributes of the pool to which the tape belongs.
The string can be either “yes”, “no”, or it can be empty. If the tape falls into a state such as
“write fenced” or “critical”, the string becomes “no”. If the string is empty, the tape is not
assigned to any pool.

used_space: <number>
Used space of the tape, in bytes. used_space = active_space + reclaimable_space.

free_space: <number>
Free space of the tape, in bytes.

active_space: <number>
Active space (used space consumed by active-referred files) of the tape, in bytes.

reclaimable_space: <number>
Reclaimable space (used space consumed by unreferred files) of the tape, in bytes. This
amount is the estimated size of the unreferenced space that is available for reclamation on
the tape.

drive_id: <string>
Drive serial number that the tape is mounted on. Empty string if the tape is not mounted.

offline_msg: <string>
Offline message that can be specified when performing offline-export.

task_id: <string>
The task_id of the task which using this tape.

location_type: <string>
The location type of the tape. The string can be either “robot”, “homeslot”, “ieslot”, “drive”,
or empty. If the string is empty, the tape is missing.

library_id: <string>
Library ID (serial number) to which the pool is belongs.

library_name: <string>
Library name that the pool is belongs to

pool_id: <string>
Pool ID to wich this tape is assigned. Empty string if the tape is not assigned to any pool.

The following are available parameters to use to filter tape requests:

barcode: <string>
Filter the list of tapes by barcode. Only the tapes that match the criteria are returned in the
response.

library_name: <string>
Filter the list of tapes by library name. Only the tapes that match the criteria are returned in
the response.
6.26.3 Libraries endpoint

The libraries endpoint returns information regarding the library that the node is connected to, such as the library ID, name and model type. The following is an example of the libraries curl command:

curl -X GET ‘http://localhost:7100/ibmsa/v1/libraries/’

The following is the response data that is returned when requesting this endpoint:

- **id**: <string>
  Serial number of the library.

- **name**: <string>
  User-defined name of the library.

- **model**: <string>
  Mode type of the library.

- **serial**: <string>
  The serial number of the library.

- **scsi_vendor_id**: <string>
  The vendor ID of the library.

- **scsi_firmware_revision**: <string>
  The firmware revision of the library.

- **num_of_drives**: <number>
  The number of tape drives that are assigned to the logical library.

- **num_of_ieslots**: <number>
  The number of I/E slots that are assigned to the logical library.

- **num_of_slots**: <number>
  The number of storage slots that are assigned to the logical library.

- **host_device_name**: <string>
  The Linux device name of the library.

- **host_scsi_address**: <string>
  The current data path to the tape drive from the assigned node, in the decimal notation of host.bus.target.lun.

- **errors**: <array>
  An array of strings that represents errors. If no error is found, an empty array is returned.
The available filtering parameter for the libraries endpoint is the name of the library.

6.26.4 Nodegroups endpoint

The nodegroups endpoint returns information regarding the node groups that the nodes are part of, such as the nodegroup ID, name, number of nodes, library ID, and library name. The following is an example of calling the nodegroups endpoint:

curl -X GET 'http://localhost:7100/ibmsa-rest/v1/nodegroups/'

The following is the response data that is returned when requesting this endpoint:

- **id**: <string>
  Nodegroup ID. Because nodegroup name is unique within a tape library only, the ID is in format of `<nodegroup_name>@<library_id>`.

- **name**: <string>
  User-specified name of the node group.

- **num_of_nodes**: <number>
  The number of nodes assigned to the node group.

- **library_id**: <string>
  The library ID (serial number) to which the node group belongs.

- **library_name**: <string>
  The name of the library to which the node group belongs.

The available filtering parameters for nodegroups are name (nodegroup name), and library_name. These parameters filter out nodegroups that do not meet the values that were passed in.

6.26.5 Nodes endpoint

The nodes endpoint returns information about each EE node assigned to the cluster. The following is an example of calling the nodes endpoint:

curl -X GET 'http://localhost:7100/ibmsa/v1/nodes/'

The following is the response data when requesting the nodes endpoint:

- **id**: <number>
  The node ID, which is the same value as the corresponding to IBM Spectrum Scale node IDs.

- **ip**: <string>
  The IP address of the node. Specifically, this is the ‘Primary network IP address’ in GPFS.

- **hostname**: <string>
  The host name of the node (the ‘GPFS daemon node interface name’ in GPFS).

- **port**: <number>
  The port number for LTFS.

- **state**: <string>
  The LE status of the node.
- **num_of_drives**: `<number>`
  The number of drives attached to the node.
- **control_node**: `<bool>`
  True if the node is configured as control node.
- **active_control_node**: `<bool>`
  True if the node is configured as a control node and is active.
- **enabled**: `<bool>`
  True, if the node is enabled.
- **library_id**: `<string>`
  The library ID of the library to which the node is attached.
- **library_name**: `<string>`
  The name of the library to which the node is attached.
- **nodegroup_id**: `<string>`
  The ID of the nodegroup to which the node belongs.
- **nodegroup_name**: `<string>`
  The name of the nodegroup to which the node belongs.

The available filtering parameters for the `nodes` endpoint are `library_name` and `nodegroup_name`. These parameters will filter out nodes that do not match the passed in values.

### 6.26.6 Drives endpoint

The `drives` endpoint returns information about each visible drive within the EE cluster. The following is an example of calling the `drives` endpoint:

```bash
curl -X GET 'http://localhost:7100/ibmsa/v1/drives/
```

The following is the response data when requesting the drives endpoint:

- **id**: `<string>`
  Serial number of the drive.
- **state**: `<string>`
  The drive state. For more information, see Table 10-1, “Status and state codes for eeadm drive list” on page 283.
- **status**: `<string>`
  The string indicates the severity level of the tape's status.
- **type**: `<string>`
  Drive type, which can be empty if a drive is not assigned to any node group.
- **role**: `<string>`
  Three character string to represent the drive role. Can be empty if a drive is not assigned to any node group.
- **address**: `<number>`
  The address of the drive within the library.
- **tape_barcode**: `<string>`
  The barcode of a tape to which the drive is mounted. Empty if no tape is mounted on the drive.
- **task_id**: `<string>`
  The task_id of the task which is using this drive.
- **library_id**: `<string>`
  The ID of the library to which the drive belongs.
- **library_name**: `<string>`
  The name of the library to which the drive belongs.
- **nodegroup_name**: `<string>`
  The name of a nodegroup to which the drive is assigned.
- **node_id**: `<string>`
  The ID of the node to which the drive is assigned.
- **node_hostname**: `<string>`
  The host name of the node to which the drive is assigned. This field can be empty if a drive is not assigned to any node.
- **scsi_vendor_id**: `<string>`
  The vendor ID of the drive.
- **scsi_product_id**: `<string>`
  The product ID of the drive.
- **scsi_firmware_revision**: `<string>`
  The firmware revision of the drive.
- **host_device_name**: `<string>`
  The linux device name of the drive.
- **host_scsi_address**: `<string>`
  The current data path to the tape drive from the assigned node, in the decimal notation of `host.bus.target.lun`.

The available filtering parameters for the drive endpoint are `library_name` and `nodegroup_name`. These parameters will filter out drives that do not match the passed drives in values.

### 6.26.7 Task endpoint

The tasks endpoint returns information about all or specific active tasks. The following is an example of calling the tasks endpoint:

```
curl -X GET 'http://localhost:7100/ibmsa/v1/tasks/'
curl -X GET 'http://localhost:7100/ibmsa/v1/tasks/<id>'
```

The following is the response data when requesting the tasks endpoint:

- **id**: `<string>`
  The task ID. Because the task id is overwritten after the task id reaches the upper limit, the id is in the format of `<task_id>@<created_time>`.
- **task_id**: <number>
  The same value as the corresponding to IBM Spectrum Scale task ID.

- **type**: <string>

- **cm_param**: <string>
  The eeadm command that user input. If the type is “transparent_recall”, the field is empty.

- **result**: <string>
  The result for completed tasks. The string can be either “succeeded”, “failed”, “aborted”, “canceled”, “suspended” or it can be empty. If the string is empty, the task is not completed.

- **status**: <string>
  The status for the task. The string can be either “waiting”, “running”, “interrupted”, “suspending”, “canceling”, “completed” or it can be empty. If the string is empty, an internal error occurs.

- **inuse_libs**: <string array>
  The libraries that the task is currently using. The value is a string array of `library.name`.

- **inuse_node_groups**: <string array>
  The node groups that the task is currently using. The value is a string array of `nodegroup.name`.

- **inuse_drives**: <string array>
  The drives that the task is currently using. The value is a string array of `drive.id`.

- **inuse_pools**: <string array>
  The pools that the task is currently using. The value is a string array of `pool.name`.

- **inuse_tapes**: <string array>
  The tapes that the task is currently using. The value is a string array of `tape.barcode`.

- **node_hostname**: <string>
  The host name of the node to which the drive is assigned. This field can be empty if a drive is not assigned to any node.

All timestamps response data return in the following UTC format:
<yyy>-<mm>-<dd>T<HH>:<mm>:<ss>.<SSS>Z

- **created_time**: <string>
  The time when the task was accepted by MMM.

- **started_time**: <string>
  The time when the task was started.

- **completed_time**: <string>
  The time when the task was determined to be completed by MMM.
The following are filtering parameters for the tasks endpoint:

- **task_id: <number>**
  
  If you specify the parameter and the task id was overwritten, you can get the latest one.

  If you specify the parameter and one of start_created_time and end_created_time, start_created_time and end_created_time do not work.

- **start_created_time: <string>**

  Filter out the tasks which created_time is earlier than this parameter.

  The format is <yyy>-<MM>-<dd>T<HH>:<mm>

- **end_created_time: <string>**

  Filter out the tasks which created_time is later than this parameter.

  The format is <yyy>-<MM>-<dd>T<HH>:<mm>

- **type: <string>**

  Filter the list of tasks by the task type.

- **result: <string>**

  Filter the list of tasks by the task result.

- **status: <string>**

  Filter the list of tasks by the task status.
Hints, tips, and preferred practices

This chapter provides you with hints, tips, and preferred practices for the IBM Spectrum Archive Enterprise Edition (IBM Spectrum Archive EE). It covers various aspects about IBM Spectrum Scale, including reuse of tape cartridges, scheduling, and disaster recovery (DR). Some aspects might overlap with functions that are described in Chapter 6, “Operations” on page 109, and Chapter 9, “Troubleshooting” on page 259. However, it is important to list them here in the context of hints, tips, and preferred practices.

This chapter includes the following topics:

- 7.1, “Preventing migration of the .SPACEMAN and metadata directories” on page 209
- 7.2, “Maximizing migration performance with redundant copies” on page 209
- 7.3, “Changing the SSH daemon settings” on page 210
- 7.4, “Setting mmapplypolicy options for increased performance” on page 211
- 7.5, “Preferred inode size for IBM Spectrum Scale file systems” on page 213
- 7.6, “Determining the file states for all files within the GPFS file system” on page 213
- 7.7, “Memory considerations on the GPFS file system for increased performance” on page 215
- 7.8, “Increasing the default maximum number of inodes in IBM Spectrum Scale” on page 216
- 7.9, “Configuring IBM Spectrum Scale settings for performance improvement” on page 217
- 7.10, “Real world use cases for mmapplypolicy” on page 217
- 7.11, “Capturing a core file on RHEL with abrtd” on page 220
- 7.12, “Antivirus considerations” on page 221
- 7.13, “Automatic email notification with rsyslog” on page 221
- 7.14, “Overlapping IBM Spectrum Scale policy rules” on page 222
- 7.15, “Storage pool assignment” on page 223
7.16, “Tape cartridge removal” on page 224
7.17, “Reusing LTFS formatted tape cartridges” on page 224
7.18, “Reusing non-LTFS tape cartridges” on page 226
7.19, “Moving tape cartridges between pools” on page 226
7.20, “Offline tape cartridges” on page 227
7.21, “Scheduling reconciliation and reclamation” on page 227
7.22, “License Expiration Handling” on page 228
7.23, “Disaster recovery” on page 228
7.24, “IBM Spectrum Archive EE problem determination” on page 234
7.25, “Collecting IBM Spectrum Archive EE logs for support” on page 234
7.26, “Backing up files within file systems that are managed by IBM Spectrum Archive EE” on page 236
7.27, “IBM TS4500 Automated Media Verification with IBM Spectrum Archive EE” on page 238
7.28, “How to disable transparent recall and IBM Spectrum Archive EE commands” on page 243

Important: All of the command examples in this chapter use the command without the full file path name because we added the IBM Spectrum Archive EE directory (/opt/ibm/ltfsee/bin) to the PATH variable of the operating system.
7.1 Preventing migration of the .SPACEMAN and metadata directories

This section describes an IBM Spectrum Scale policy rule that you should have in place to help ensure the correct operation of your IBM Spectrum Archive EE system.

You can prevent migration of the .SPACEMAN directory and the IBM Spectrum Archive EE metadata directory of a GPFS file system by excluding these directories by having an IBM Spectrum Scale policy rule in place. Example 7-1 shows how an exclude statement can look in an IBM Spectrum Scale migration policy file where the metadata directory starts with the text “/ibm/glues/.ltfsee”.

Example 7-1 IBM Spectrum Scale sample directory exclude statement in the migration policy file

```plaintext
define(
    user_exclude_list,
    (
        PATH_NAME LIKE '/ibm/glues/.ltfsee/%'
        OR PATH_NAME LIKE '/.SpaceMan/%'
        OR PATH_NAME LIKE '/.snapshots/%'
    )
)
```

For more information and detailed examples, see 6.11.2, “Threshold-based migration” on page 146 and 6.11.3, "Manual migration" on page 151.

7.2 Maximizing migration performance with redundant copies

To minimize drive mounts/unmounts and to maximize performance with multiple copies, set the mount limit per tape cartridge pool to equal the number of tape drives in the node group divided by the number of copies. The mount limit attribute of a tape cartridge pool specifies the maximum allocated number of drives that are used for migration for the tape cartridge pool. A value of 0 means no limit and is also the default value.

For example, if there are four drives and two copies initially, set the mount limit to 2 for the primary tape cartridge pool and 2 for the copy tape cartridge pool. These settings maximize the migration performance because both the primary and copy jobs are run in parallel by using two tape drives each for each tape cartridge pool. This action also avoids unnecessary mounts/unmounts of tape cartridges.

To show the current mount limit setting for a tape cartridge pool, run the following command:

```
eeadm pool show <poolname> [-l <libraryname>] [OPTIONS]
```

To set the mount limit setting for a tape cartridge pool, run the following command:

```
eeadm pool set <poolname> [-l <libraryname>] -a <attribute> -v <value>
```
To set the mount limit attribute to 2, run the `eeadm pool show` and `eeadm pool set` commands, as shown in Example 7-2.

**Example 7-2  Set the mount limit attribute to 2**

```
[root@saitama1 ~]# eeadm pool show pool1 -l lib_saitama
Attribute                  Value
poolname                   pool1
poolid                     813ee595-2191-4e32-ae0e-74714715bb43
devtype                    3592
mediarestriction           none
format                     E08 (0x55)
worm                       no (0)
nodegroup                  G0
fillpolicy                 Default
owner                      System
mountlimit                 0
lowspacewarningenable      yes
lowspacewarningthreshold   0
nospacewarningenable       yes
mode                       normal
```

```
[root@saitama1 ~]# eeadm pool set pool1 -l lib_saitama -a mountlimit -v 2
```

```
[root@saitama1 ~]# eeadm pool show pool1 -l lib_saitama
Attribute                  Value
poolname                   pool1
poolid                     813ee595-2191-4e32-ae0e-74714715bb43
devtype                    3592
mediarestriction           none
format                     E08 (0x55)
worm                       no (0)
nodegroup                  G0
fillpolicy                 Default
owner                      System
mountlimit                 2
lowspacewarningenable      yes
lowspacewarningthreshold   0
nospacewarningenable       yes
mode                       normal
```

### 7.3 Changing the SSH daemon settings

The default values for `MaxSessions` and `MaxStartups` are too low and must increase to allow for successful operations with IBM Spectrum Archive EE:

- **MaxSessions** specifies the maximum number of open sessions that is permitted per network connection. The default is 10.
- **MaxStartups** specifies the maximum number of concurrent unauthenticated connections to the SSH daemon. More connections are dropped until authentication succeeds or the `LoginGraceTime` expires for a connection. The default is 10:30:100.
To change **MaxSessions** to 60 and **MaxStartups** to 1024, complete the following steps:

1. Edit the `/etc/ssh/sshd_config` file to set the `MaxSessions` and `MaxStartups` values:
   ```
   MaxSessions = 60
   MaxStartups = 1024
   ```
2. Restart the `sshd` service by running the following command:
   ```
   systemctl restart sshd.service
   ```

**Note:** If SSH is slow, this might indicate that several things might be wrong. Often disabling GSSAPI Authentication and reversing DNS lookup will resolve this problem and speed up SSH. Thus, set the following lines in the `sshd_config` file:

```
GSSAPIAuthentication no
UseDNS no
```

## 7.4 Setting `mmapplypolicy` options for increased performance

The default values of the `mmapplypolicy` command options must be changed when running with IBM Spectrum Archive EE. The values for these three options should be increased for enhanced performance:

- **-B MaxFiles**
  Specifies how many files are passed for each invocation of the EXEC script. The default value is 100. If the number of files exceeds the value that is specified for `MaxFiles`, `mmapplypolicy` starts the external program multiple times.

  The preferred value for IBM Spectrum Archive EE is 10000.

- **-m ThreadLevel**
  The number of threads that are created and dispatched within each `mmapplypolicy` process during the policy execution phase. The default value is 24.

  The preferred value for IBM Spectrum Archive EE is 2x the number of drives.

- **--single-instance**
  Ensures that, for the specified file system, only one instance of `mmapplypolicy` that is started with the **--single-instance** option can run at one time. If another instance of `mmapplypolicy` is started with the **--single-instance** option, this invocation does nothing and terminates.

  As a preferred practice, set the **--single_instance** option when running with IBM Spectrum Archive EE.

- **-s LocalWorkDirectory**
  Specifies the directory to be used for temporary storage during `mmapplypolicy` command processing. The default directory is `/tmp`. The `mmapplypolicy` command stores lists of candidate and chosen files in temporary files within this directory.

  When you run `mmapplypolicy`, it creates several temporary files and file lists. If the specified file system or directories contain many files, this process can require a significant amount of temporary storage. The required storage is proportional to the number of files (NF) being acted on and the average length of the path name to each file (AVPL).

  To make a rough estimate of the space required, estimate NF and assume an AVPL of 80 bytes. With an AVPL of 80, the space required is roughly 300 X NF bytes of temporary space.
-N {all | mount | Node[,Node...] | NodeFile | NodeClass}

Specifies a set of nodes to run parallel instances of policy code for better performance. The nodes must be in the same cluster as the node from which the `mmapplypolicy` command is issued. All node classes are supported.

If the `-N` option is not specified, then the command runs parallel instances of the policy code on the nodes that are specified by the `defaultHelperNodes` attribute of the `mmchconfig` command. If the `defaultHelperNodes` attribute is not set, then the list of helper nodes depends on the file system format version of the target file system. If the target file system is at file system format version 5.0.1 or later (file system format number 19.01 or later), then the helper nodes are the members of the node class `managerNodes`. Otherwise, the command runs only on the node where the `mmapplypolicy` command is issued.

**Note:** When using `-N` specify only the class defined for IBM Spectrum Archive EE nodes, except for `-I defer` or `-I prepare`.

- `g GlobalWorkDirectory`

Specifies a global work directory in which one or more nodes can store temporary files during `mmapplypolicy` command processing. For more information about specifying more than one node to process the command, see the description of the `-N` option. For more information about temporary files, see the description of the `-s` option.

The global directory can be in the file system that `mmapplypolicy` is processing or in another file system. The file system must be a shared file system, and it must be mounted and available for reading and writing by every node that will participate in the `mmapplypolicy` command processing.

If the `-g` option is not specified, then the global work directory is the directory that is specified by the `sharedTmpDir` attribute of the `mmchconfig` command. If the `sharedTmpDir` attribute is not set to a value, then the global work directory depends on the file system format version of the target file system:

- If the target file system is at file system format version 5.0.1 or later (file system format number 19.01 or later), then the global work directory is the directory `.mmSharedTmpDir` at the root level of the target file system.
- If the target file system is at a file system format version that is earlier than 5.0.1 then the command does not use a global work directory.

If the global work directory that is specified by `-g` option or by the `sharedTmpDir` attribute begins with a forward slash (/) then it is treated as an absolute path. Otherwise it is treated as a path that is relative to the mount point of the file system or the location of the directory to be processed.

If both the `-g` option and the `-s` option are specified, then temporary files can be stored in both the specified directories. In general, the local work directory contains temporary files that are written and read by a single node. The global work directory contains temporary files that are written and read by more than one node.

If both the `-g` option and the `-N` option are specified, then `mmapplypolicy` uses high-performance, fault-tolerant protocols during execution.

**Note:** It is always a preferred practice to specify the `temp` directory to something other than `/tmp` in case the temporary files get large. This can be the case in large file systems, and the use of the IBM Spectrum Scale file system is suggested.
7.5 Preferred inode size for IBM Spectrum Scale file systems

When you create the GPFS file systems, an option is available that is called \texttt{-i InodeSize} for the \texttt{mmcrfs} command. The option specifies the byte size of inodes. By default, the inode size is 4 KB and it consists of a fixed 128 byte header, plus data, such as disk addresses pointing to data, or indirect blocks, or extended attributes.

The supported inode sizes are 512, 1024, and 4096 bytes. Regardless of the file sizes, the preferred inode size is 4096 for all IBM Spectrum Scale file systems for IBM Spectrum Archive EE. This size should include user data file systems and the IBM Spectrum Archive EE metadata file system.

7.6 Determining the file states for all files within the GPFS file system

Typically, to determine the state of a file and to which tape cartridges the file is migrated, you run the \texttt{eeadm file state} command. However, it is not practical to run this command for every file on the GPFS file system.

In Example 7-3, the file is in the migrated state and is only on the tape cartridge JD0321JD.

\begin{example}
\textbf{Example 7-3}  \ Example of the eeadm info files command
\begin{verbatim}
[root@saitama1 prod]# eeadm file state LTFS_EE_FILE_2dEPRHhh_M.bin
Name: /ibm/gpfs/prod/LTFS_EE_FILE_2dEPRHhh_M.bin
State: premigrated
ID: 1115164813451819981-3451838792894073-1435527450-974349-0
Replicas: 1
Tape 1: JD0321JD@test4@lib_saitama (tape state=appendable)
\end{verbatim}
\end{example}

Thus, use list rules in an IBM Spectrum Scale policy instead. Example 7-4 is a sample set of list rules to display files and file system objects. For those files that are in the migrated or premigrated state, the output line contains the tape cartridges on which that file is.

\begin{example}
\textbf{Example 7-4}  \ Sample set of list rules to display the file states
\begin{verbatim}
define( 
  user_exclude_list,
  ( 
    PATH_NAME LIKE '/ibm/glues/.ltfsee/%'
    OR PATH_NAME LIKE '/.SpaceMan/%'
    OR PATH_NAME LIKE '/lost+found/%'
    OR NAME = 'dsmerror.log'
  )
)

define( 
  is_premigrated,
  (MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%')
)

define( 
  is_migrated,
  (MISC_ATTRIBUTES LIKE '%V%')
)
\end{verbatim}
\end{example}
define(
    is_resident,
    (NOT MISC_ATTRIBUTES LIKE '%M%')
)

define(
    is_symlink,
    (MISC_ATTRIBUTES LIKE '%L%')
)

define(
    is_dir,
    (MISC_ATTRIBUTES LIKE '%D%')
)

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'

RULE EXTERNAL LIST 'file_states' EXEC '/root/file_states.sh'

RULE 'EXCLUDE_LISTS' LIST 'file_states' EXCLUDE WHERE user_exclude_list

RULE 'MIGRATED' LIST 'file_states' FROM POOL 'system' SHOW('migrated ' || xattr('dmapi.IBMTPS')) WHERE is_migrated

RULE 'PREMIGRATED' LIST 'file_states' FROM POOL 'system' SHOW('premigrated ' || xattr('dmapi.IBMTPS')) WHERE is_premigrated

RULE 'RESIDENT' LIST 'file_states' FROM POOL 'system' SHOW('resident ') WHERE is_resident AND (FILE_SIZE > 0)

RULE 'SYMLINKS' LIST 'file_states' DIRECTORIES_PLUS FROM POOL 'system' SHOW('symlink ') WHERE is_symlink

RULE 'DIRS' LIST 'file_states' DIRECTORIES_PLUS FROM POOL 'system' SHOW('dir ') WHERE is_dir AND NOT user_exclude_list

RULE 'EMPTY_FILES' LIST 'file_states'
FROM POOL 'system'
SHOW('empty_file ')
WHERE (FILE_SIZE = 0)

The policy runs a script that is named file_states.sh, which is shown in Example 7-5. If the policy is run daily, this script can be modified to keep several versions to be used for history purposes.

Example 7-5   Example of file_states.sh

```bash
if [[ $1 == 'TEST' ]]; then
    rm -f /root/file_states.txt
elif [[ $1 == 'LIST' ]]; then
    cat $2 >> /root/file_states.txt
fi
```

To run the IBM Spectrum Scale policy, run the `mmapplypolicy` command with the `-P` option and the file states policy. This action produces a file that is called `/root/file_states.txt`, as shown in Example 7-6.

Example 7-6   Sample output of the `/root/file_states.txt` file

```
355150 165146835 0  dir  -- /ibm/gpfs/prod
974348 2015134857 0  premigrated 1
    JD0321JD@1d85a188-be4e-4ab6-a300-e5c99061ceec4@ebc1b34a-1bd8-4c86-b4fb-bee7b60c24c7
    -- /ibm/gpfs/prod/LTFS_EE_FILE_9_rzu.bin
974349 1435527450 0  premigrated 1
    JD0321JD@1d85a188-be4e-4ab6-a300-e5c99061ceec4@ebc1b34a-1bd8-4c86-b4fb-bee7b60c24c7
    -- /ibm/gpfs/prod/LTFS_EE_FILE_2dEPRHhh_M.bin
974350 599546382 0  premigrated 1
    JD0321JD@1d85a188-be4e-4ab6-a300-e5c99061ceec4@ebc1b34a-1bd8-4c86-b4fb-bee7b60c24c7
    -- /ibm/gpfs/prod/LTFS_EE_FILE_XH7Qwj5y9j2wqV4615rCxPMir039xLlt68sSZn_eoCj0.bin
```

In the `/root/file_states.txt` file, the files states and file system objects can be easily identified for all IBM Spectrum Scale files, including the tape cartridges where the files or file system objects are.

### 7.7 Memory considerations on the GPFS file system for increased performance

To make IBM Spectrum Scale more resistant to out of memory scenarios, adjust the `vm.min_free_kbytes` kernel tunable. This tunable controls the amount of free memory that Linux kernel keeps available (that is, not used in any kernel caches).

When `vm.min_free_kbytes` is set to its default value, some configurations might encounter memory exhaustion symptoms when free memory should in fact be available. Setting `vm.min_free_kbytes` to a higher value of 5-6% of the total amount of physical memory, up to a max of 2 GB, helps to avoid such a situation.
To modify `vm.min_free_kbytes`, complete the following steps:

1. Check the total memory of the system by running the following command:
   
   ```
   #free -k
   ```

2. Calculate 5-6% of the total memory in KB with a max of 2000000.

3. Add `vm.min_free_kbytes = <value from step 2>` to the `/etc/sysctl.conf` file.

4. Run `sysctl -p /etc/sysctl.conf` to permanently set the value.

### 7.8 Increasing the default maximum number of inodes in IBM Spectrum Scale

The IBM Spectrum Scale default maximum number of inodes is fine for most configurations. However, for large systems that might have millions of files or more, the maximum number of inodes to set at file system creation time might need to be changed or increased after file system creation time. The maximum number of inodes must be larger than the expected sum of files and file system objects being managed by IBM Spectrum Archive EE (including the IBM Spectrum Archive EE metadata files if there is only one GPFS file system).

Inodes are allocated when they are used. When a file is deleted, the inode is reused, but inodes are never deallocated. When setting the maximum number of inodes in a file system, there is an option to preallocate inodes. However, in most cases there is no need to preallocate inodes because by default inodes are allocated in sets as needed.

If you do decide to preallocate inodes, be careful not to preallocate more inodes than will be used. Otherwise, the allocated inodes unnecessarily consume metadata space that cannot be reclaimed.

Consider the following points when managing inodes:

- For file systems that are supporting parallel file creates, as the total number of free inodes drops below 5% of the total number of inodes, there is the potential for slowdown in the file system access. Take this situation into consideration when creating or changing your file system.

- Excessively increasing the value for the maximum number of files might cause the allocation of too much disk space for control structures.

To view the current number of used inodes, number of free inodes, and maximum number of inodes, run the following command:

```
mmdf Device
```

To set the maximum inode limit for the file system, run the following command:

```
mmchfs Device --inode-limit MaxNumInodes[:NumInodesToPreallocate]```
7.9 Configuring IBM Spectrum Scale settings for performance improvement

The performance results in 3.4.3, “Performance” on page 47 were obtained by modifying the following IBM Spectrum Scale configuration attributes to optimize IBM Spectrum Scale I/O. In most environments, only a few of the configuration attributes need to be changed. The following values were found to be optimal in our lab environment and are suitable for most environments:

- `pagepool` = 50-60% of the physical memory of the server
- `workerThreads` = 1024
- `numaMemoryInterleave` = yes
- `maxStatCache` = 0
- `maxFilesToCache` = 128k

The file system block size should be 2 MB due to a disk subsystem of eight data disks plus one parity disk with a stripe size of 256 KB.

**Note:** The `workerThread` setting is only available in IBM Spectrum Scale v4.2.1 or later. The `workerThreads` parameter controls an integrated group of variables that tune the file system performance in environments that are capable of high sequential and random read and write workloads and small file activity.

7.10 Real world use cases for mmapplypolicy

Typically, customers who use IBM Spectrum Archive with IBM Spectrum Scale manage one of two types of archive systems. The first is a traditional archive configuration where files are rarely accessed or updated. This configuration is intended for users who plan on keeping all their data on tape only. The second type is an active archive configuration. This configuration is more intended for users who continuously accesses the files. Each use case requires the creation of different IBM Spectrum Scale policies.

7.10.1 Creating a traditional archive system policy

A traditional archive system uses a single policy that scans the IBM Spectrum Archive name space for any files over 5 MB and migrates them to tape. This process saves the customer disk space immediately for new files to be generated. See “Using a cron job” on page 154 for information about how to automate the execution of this policy periodically.

**Note:** In the following policies, some optional attributes are added to provide efficient (pre)migration such as the `SIZE` attribute. This attribute specifies how many files to pass in to the `EXEC` script at a time. The preferred setting, which is listed in the following examples, is to set it to 20 GiB.
Example 7-7 shows a simple migration policy that chooses files greater than 5 MB to be candidate migration files and stubs them to tape. This is a good base policy that you can modify to your specific needs. For instance, if you need to have files on three storage pools, modify the OPTS parameter to include a third `<pool>@<library>`.

Example 7-7  Simple migration file

```bash
define(user_exclude_list,(PATH_NAME LIKE '/ibm/gpfs/.ltfsee/%' OR PATH_NAME LIKE '/ibm/gpfs/.SpaceMan/%'))
define(is_premigrated,(MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%'))
define(is_migrated,(MISC_ATTRIBUTES LIKE '%V%'))
define(is_resident,(NOT MISC_ATTRIBUTES LIKE '%M%'))

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'
RULE EXTERNAL POOL 'LTFSEE_FILES'
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS '-p primary@lib_ltfseevm copy@lib_ltfseevm'
SIZE(20971520)

RULE 'LTFSEE_FILES_RULE' MIGRATE FROM POOL 'system'
TO POOL 'LTFSEE_FILES'
WHERE FILE_SIZE > 5242880
AND (CURRENT_TIMESTAMP - MODIFICATION_TIME > INTERVAL '5' MINUTES)
AND is_resident OR is_premigrated
AND NOT user_exclude_list
```

7.10.2 Creating active archive system policies

An active archive system requires two policies to maintain the system. The first is a premigration policy that selects all files over 5 MB to premigrate to tape, allowing users to still quickly obtain their files from disk. To see how to place this premigration policy into a cron job to run every 6 hours, see “Using a cron job” on page 154.

Example 7-8 shows a simple premigration policy for files greater than 5 MB.

Example 7-8  Simple premigration policy for files greater than 5 MB

```bash
define(user_exclude_list,(PATH_NAME LIKE '/ibm/gpfs/.ltfsee/%' OR PATH_NAME LIKE '/ibm/gpfs/.SpaceMan/%'))
define(is_premigrated,(MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%'))
define(is_migrated,(MISC_ATTRIBUTES LIKE '%V%'))
define(is_resident,(NOT MISC_ATTRIBUTES LIKE '%M%'))

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'
RULE EXTERNAL POOL 'LTFSEE_FILES'
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS '-p primary@lib_ltfseevm copy@lib_ltfseevm'
SIZE(20971520)

RULE 'LTFSEE_FILES_RULE' MIGRATE FROM POOL 'system'
TO POOL 'LTFSEE_FILES'
THRESHOLD(0,100,0)
```
WHERE FILE_SIZE > 5242880
AND (CURRENT_TIMESTAMP - MODIFICATION_TIME > INTERVAL '5' MINUTES)
AND is_resident
AND NOT user_exclude_list

The second policy is a fail-safe policy that needs to be set so when a low disk space event is triggered, the fail-safe policy can be called. Adding the WEIGHT attribute to the policy enables the user to choose whether they want to start stubbing large files first or least recently used files. When the fail-safe policy starts running, it frees up the disk space to a set percentage.

The following commands are used for setting a fail-safe policy and calling mmaddcallback:

```
> mmchpolicy gpfs failsafe_policy.txt
> mmaddcallback MIGRATION --command /usr/lpp/mmfs/bin/mmapplypolicy --event lowDiskSpace --parms ""%fsName -B 20000 -m <2x the number of drives> --single-instance"
```

After setting the policy with the mmchpolicy command, run mmaddcallback with the fail-safe policy. This policy runs periodically to check whether the disk space has reached the threshold where stubbing is required to free up space.

Example 7-9 shows a simple failsafe_policy.txt, which gets triggered when the IBM Spectrum Scale disk space reaches 80% full, and stubs least recently used files until the disk space has 50% occupancy.

```
Example 7-9  failsafe_policy.txt
define(user_exclude_list,(PATH_NAME LIKE '/ibm/gpfs/.ltfsee/*' OR PATH_NAME LIKE '/ibm/gpfs/.SpaceMan/*'))
define(is_premigrated,(MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%'))
define(is_migrated,(MISC_ATTRIBUTES LIKE '%V%'))
define(is_resident,(NOT MISC_ATTRIBUTES LIKE '%M%'))

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'
RULE EXTERNAL POOL 'LTFSEE_FILES'
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS '-p primary@lib_ltfsee copy@lib_ltfsee copy2@lib_ltfsee'
SIZE(20971520)

RULE 'LTFSEE_FILES_RULE' MIGRATE FROM POOL 'system'
THRESHOLD(80,50)
WEIGHT(CURRENT_TIMESTAMP - ACCESS_TIME)
TO POOL 'LTFSEE_FILES'
WHERE FILE_SIZE > 5242880
AND is_premigrated
AND NOT user_exclude_list
```
7.10.3 IBM Spectrum Archive EE migration policy with AFM

For customers using IBM Spectrum Archive EE with IBM Spectrum Scale AFM, the migration policy would need to change to accommodate the extra exclude directories wherever migrations are occurring. Example 7-10 uses the same migration policy that is shown in Example 7-7 on page 218 with the addition of extra exclude and check parameters.

Example 7-10 Updated migration policy to include AFM

```plaintext
define(user_exclude_list,(PATH_NAME LIKE '/ibm/gpfs/.ltfsee/%' OR PATH_NAME LIKE '/ibm/gpfs/.SpaceMan/%' OR PATH_NAME LIKE '%/.snapshots/%' OR PATH_NAME LIKE '/ibm/gpfs/fset1/.afm/%' OR PATH_NAME LIKE '/ibm/gpfs/fset1/.ptrash/%'))

define(is_premigrated,(MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%'))

define(is_migrated,(MISC_ATTRIBUTES LIKE '%V%'))

define(is_resident,(NOT MISC_ATTRIBUTES LIKE '%M%'))

define(is_cached,(MISC_ATTRIBUTES LIKE '%u%'))

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'
RULE EXTERNAL POOL 'LTFSEE_FILES'
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS '-p primary@lib_ltfseevm copy@lib_ltfseevm'
SIZE(20971520)
RULE 'LTFSEE_FILES_RULE' MIGRATE FROM POOL 'system'
THRESHOLD(0,100,0)
TO POOL 'LTFSEE_FILES'
WHERE FILE_SIZE > 5242880
AND (CURRENT_TIMESTAMP - MODIFICATION_TIME > INTERVAL '5' MINUTES)
AND is_resident
AND is_cached
AND NOT user_exclude_list
```

7.11 Capturing a core file on RHEL with abrtd

The Automatic Bug Reporting Tool (ABRT) consists of the `abrtd` daemon and a number of system services and utilities to process, analyze, and report detected problems. The daemon runs silently in the background most of the time, and springs into action when an application crashes or a kernel fault is detected. The daemon then collects the relevant problem data, such as a core file if there is one, the crashing application’s command-line parameters, and other data of forensic utility.
For **abrt** to work with IBM Spectrum Archive EE, two configuration directives must be modified in the `/etc/abrt/abrt-action-save-package-data.conf` file:

- **OpenGPGCheck = yes/no**
  
  Setting the `OpenGPGCheck` directive to `yes`, which is the default setting, tells ABRT to analyze and handle only crashes in applications that are provided by packages that are signed by the GPG keys, which are listed in the `/etc/abrt/gpg_keys` file. Setting `OpenGPGCheck` to `no` tells ABRT to detect crashes in all programs.

- **ProcessUnpackaged = yes/no**
  
  This directive tells ABRT whether to process crashes in executable files that do not belong to any package. The default setting is `no`.

Here are the preferred settings:

- `OpenGPGCheck = no`
- `ProcessUnpackaged = yes`

### 7.12 Antivirus considerations

Although in-depth testing occurs with IBM Spectrum Archive EE and many industry-leading antivirus software programs, there are a few considerations to review periodically:

- Configure any antivirus software to exclude IBM Spectrum Archive EE and HSM work directories:
  - The library mount point (the `/ltfs` directory).
  - All IBM Spectrum Archive EE space-managed GPFS file systems (which includes the `.SPACEMAN` directory).
  - The IBM Spectrum Archive EE metadata directory (the GPFS file system that is reserved for IBM Spectrum Archive EE internal usage).
- Use antivirus software that supports sparse or offline files. Be sure that it has a setting that allows it to skip offline or sparse files to avoid unnecessary recall of migrated files.

### 7.13 Automatic email notification with rsyslog

Rslogs and its mail output module (ommail) can be used to send syslog messages from IBM Spectrum Archive EE through email. Each syslog message is sent through its own email. Users should pay special attention to applying the correct amount of filtering to prevent heavy spamming. The ommail plug-in is primarily meant for alerting users of certain conditions and should be used in a limited number of cases. For more information, see this website.

Here are two examples of how rsyslog ommail can be used with IBM Spectrum Archive EE by modifying the `/etc/rsyslog.conf` file:

- If users want to send an email on all IBM Spectrum Archive EE registered error messages, the regular expression is `GLES[A-Z][0-9]*E`, as shown in Example 7-11.

**Example 7-11   Email for all IBM Spectrum Archive EE registered error messages**

```
$ModLoad ommail
$ActionMailSMTPServer us.ibm.com
$ActionMailFrom ltfsee@ltfsee_host1.tuc.stglabs.ibm.com
$ActionMailTo ltfsee_user1@us.ibm.com
```
$template mailSubject,"LTFS EE Alert on %hostname%"
$template mailBody,"%msg%"
$ActionMailSubject mailSubject
  :msg, regex, "GLES[A-Z][0-9]*E" :ommail:;mailBody

- If users want to send an email on any failed migration per scan list, the regular expression is "[1-9][0-9]* failed", as shown in Example 7-12.

Example 7-12  Email for any failed migration per scan list

$ModLoad ommail
$ActionMailSMTPServer us.ibm.com
$ActionMailFrom ltfsee@ltfsee_host1.tuc.stglabs.ibm.com
$ActionMailTo ltfsee_user1@us.ibm.com
$template mailSubject,"LTFS EE Alert on %hostname%"
$template mailBody,"%msg%"
$ActionMailSubject mailSubject
  :msg, regex, " [1-9][0-9]* failed" :ommail:;mailBody

7.14 Overlapping IBM Spectrum Scale policy rules

This section describes how you can avoid migration failures during your IBM Spectrum Archive EE system operations by having only non-overlapping IBM Spectrum Scale policy rules in place.

After a file is migrated to a tape cartridge pool and is in the migrated state, it cannot be migrated to other tape cartridge pools (unless it is recalled back from physical tape to file system space).

Do not use overlapping IBM Spectrum Scale policy rules within different IBM Spectrum Scale policy files that can select the same files for migration to different tape cartridge pools. If a file was migrated, a later migration fails. The migration result for any file that already is in the migrated state is fail.

In Example 7-13, an attempt is made to migrate four files to tape cartridge pool pool2. Before the migration attempt, Tape ID JD0321JD is already in tape cartridge pool pool1, and Tape ID JCB610JC has one migrated and one pre-migrated file. The state of the files on these tape cartridges before the migration attempt is shown by the eeadm file state command in Example 7-13.

Example 7-13  Display the state of files by using the eeadm file state command

[root@saitama1 prod]# eeadm file state *.bin
Name: /ibm/gpfs/prod/fileA.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-1435527450-974349-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileB.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-2015134857-974348-0
Replicas: 1
Tape 1: JCB610JC@pool1@lib_saitama (tape state=appendable)
Name: /ibm/gpfs/prod/fileC.ppt
State: migrated
ID: 11151648183451819981-3451383879228984073-599546382-974350-0
Replicas: 1
Tape 1: JD0321JD@pool1@lib_saitama (tape state=appendable)

Name: /ibm/gpfs/prod/fileD.ppt
State: premigrated
ID: 11151648183451819981-3451383879228984073-2104982795-3068894-0
Replicas: 1
Tape 1: JD0321JD@pool2@lib_saitama (tape state=appendable)

The mig scan list file that is used in this example contains these entries, as shown in Example 7-14.

Example 7-14   Sample content of a scan list file
-- /ibm/gpfs/fileA.ppt
-- /ibm/gpfs/fileB.ppt
-- /ibm/gpfs/fileC.ppt
-- /ibm/gpfs/fileD.ppt

The attempt to migrate the files produces the results that are shown in Example 7-15.

Example 7-15   Migration of files by running the eeadm migration command
[root@saitama1 prod]# eeadm migrate mig -p pool2@lib_saitama
2019-01-11 15:58:51 GLES700I: Task migrate was created successfully, task id is 7195.
2019-01-11 15:58:51 GLESM896I: Starting the stage 1 of 3 for migration task 7195 (qualifying the state of migration candidate files).
2019-01-11 15:58:51 GLESM897I: Starting the stage 2 of 3 for migration task 7195 (copying the files to 1 pools).
2019-01-11 15:58:51 GLESM898I: Starting the stage 3 of 3 for migration task 7195 (changing the state of files on disk).
2019-01-11 15:58:52 GLESL159E: Not all migration has been successful.
2019-01-11 15:58:52 GLESL159E: Migration result: 1 succeeded, 3 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.

The files on Tape ID JC8610JC (fileA.ppt and fileB.pdf) already are in tape cartridge pool pool1. Therefore, the attempt to migrate them to tape cartridge pool pool2 produces a migration result failed.

For the files on Tape ID JD0321JD, the attempt to migrate fileC.ppt file also produces a migration result fail because the file is already migrated. Only the attempt to migrate the pre-migrated fileD.ppt file succeeds. Therefore, one operation succeeded and three other operations failed.

7.15  Storage pool assignment

This section describes how you can facilitate your IBM Spectrum Archive EE system export activities by using different storage pools for logically different parts of an IBM Spectrum Scale namespace.
If you put different logical parts of an IBM Spectrum Scale namespace (such as the project directory) into different LTFS tape cartridge pools, you can Normal Export tape cartridges that contain only the files from that specific part of the IBM Spectrum Scale namespace (such as project abc). Otherwise, you must first recall all the files from the namespace of interest (such as the project directory of all projects), migrate the recalled files to an empty tape cartridge pool, and then Normal Export that tape cartridge pool.

The concept of different tape cartridge pools for different logical parts of an IBM Spectrum Scale namespace can be further isolated by using IBM Spectrum Archive node groups. A node group consists of one or more nodes that are connected to the same tape library. When tape cartridge pools are created, they can be assigned to a specific node group. For migration purposes, it allows certain tape cartridge pools to be used with only drives within the owning node group.

### 7.16 Tape cartridge removal

This section describes the information that must be reviewed before you physically remove a tape cartridge from the library of your IBM Spectrum Archive EE environment.

For more information, see 6.8.2, “Moving tape cartridges” on page 135, and “The eeadm <resource type> --help command” on page 282.

#### 7.16.1 Reclaiming tape cartridges before you remove or export them

If tape cartridges are going bad, reclaim tape cartridges before you remove or Normal Export them. To avoid failed recall operations, reclaim a tape cartridge using one of these methods:

- Running the `eeadm tape reclaim` command before you remove it from the LTFS file system (by running the `eeadm tape move` command)
- Export it from the LTFS library (by running the `eeadm tape export` command)

#### 7.16.2 Exporting tape cartridges before physically removing them from the library

A preferred practice is always to export a tape cartridge before it is physically removed from the library. If a removed tape cartridge is modified and then reinserted in the library, unpredictable behavior can occur.

### 7.17 Reusing LTFS formatted tape cartridges

In some scenarios, you might want to reuse tape cartridges for your IBM Spectrum Archive EE setup, which were used before as an LTFS formatted media in another LTFS setup.

Because these tape cartridges still might contain data from the previous usage, IBM Spectrum Archive EE recognizes the old content because LTFS is a self-describing format.

Before such tape cartridges can be reused within your IBM Spectrum Archive EE environment, the data must be moved off the cartridge or deleted from the file system then the cartridges must be reformatted before they are added to an IBM Spectrum Archive EE tape cartridge pool. This task can be done by running the `eeadm tape reclaim` or `eeadm tape unassign -E` commands.
7.17.1 Reformatting LTFS tape cartridges through eeadm commands

If a tape cartridge was used as an LTFS tape, you can check its contents after it is added to
the IBM Spectrum Archive EE system and loaded to a drive. You can run the `ls -la`
command to display content of the tape cartridge, as shown in Example 7-16.

Example 7-16  Display content of a used LTFS tape cartridge (non-IBM Spectrum Archive EE)

```
[root@ltfs97 ~]# ls -la /ltfs/153AGWL5
total 41452613
  drwxrwxrwx  2 root root           0 Jul 12  2012 .
  drwxrwxrwx 12 root root           0 Jan  1 1970 ..
-rwxrwxrwx  1 root root 18601 Jul 12  2012 api_test.log
-rwxrwxrwx  1 root root 50963 Jul 11  2012 config.log
-rwxrwxrwx  1 root root 1048576 Jul 12  2012 dummy.000
-rwxrwxrwx  1 root root 21474836480 Jul 12  2012 perf_fcheck.000
-rwxrwxrwx  1 root root 20971520000 Jul 12  2012 perf_migrec
lrwxrwxrwx  1 root root 25 Jul 12  2012 symfile -> /Users/piste/mnt/testfile
```

You can also discover if it was an IBM Spectrum Archive EE tape cartridge before or just a
standard LTFS tape cartridge that is used by IBM Spectrum Archive LE or IBM Spectrum
Archive SDE release. Review the hidden directory `.LTFSEE_DATA`, as shown in Example 7-17.
This example indicates that this cartridge was previously used as an IBM Spectrum Archive
EE tape cartridge.

Example 7-17  Display content of a used LTFS tape cartridge (IBM Spectrum Archive EE)

```
[root@ltfs97 ltfs]# ls -lsa /ltfs/JD0321JD
total 0
  0 drwxrwxrwx  4 root root 0 Jan 9 14:33 .
  0 drwxrwxrwx  7 root root 0 Dec 31 1969 ..
  0 drwxrwxrwx  3 root root 0 Jan 9 14:33 ibm
  0 drwxrwxrwx  2 root root 0 Jan 10 16:01 .LTFSEE_DATA
```

The procedure for reuse and reformatting of a previously used LTFS tape cartridge depends
on whether it was used before as an IBM Spectrum Archive LE or IBM Spectrum Archive SDE
tape cartridge or as an IBM Spectrum Archive EE tape cartridge.

Before you start with the reformat procedures and examples, it is important that you confirm
the following starting point. You can see the tape cartridges that you want to reuse by running
the `eeadm tape list` command in the status `unassign`, as shown in Example 7-18.

Example 7-18  Output of the eeadm tape list command

```
[root@saltama2 ltfs]# eeadm tape list -l lib_saltama
Tape ID  Status  State         Usable(GiB)  Used(GiB)  Available(GiB)  Reclaimable Pool   Library   Location Task ID
JCA561JC  ok      offline                  0          0               0            0%  pool2 lib_saltama homeslot -
JCA224JC  ok      appendable            6292          0 6292            0%  pool1 lib_saltama homeslot -
JCC093JC  ok      appendable            6292        496    5796            0%  pool1 lib_saltama homeslot -
JCB141JC  ok      unassigned               0          0               0%  pool2 lib_saltama homeslot -
```
Reformatting and reusing an LTFS SDE/LE tape cartridge

In this case, you run the `eeadm tape assign` command to add this tape cartridge to an IBM Spectrum Archive EE tape cartridge pool and format it at the same time, as shown in the following example and in Example 7-19:

```
eeadm tape assign <list_of_tapes> -p <pool> [OPTIONS]
```

If the format fails then there is data most likely written to the tape and a force format is required by appending the `-f` option to the `eeadm tape assign` command.

**Example 7-19  Reformat a used LTFS SDE/LE tape cartridge**

```
[root@saitama2 ~]# eeadm tape assign JCB141JC -p pool1 -l lib_saitama -f
2019-01-15 08:35:21 GLESL700I: Task tape_assign was created successfully, task id is 7201.
```

Reformatting and reusing an IBM Spectrum Archive EE tape cartridge

If you want to reuse an IBM Spectrum Archive EE tape cartridge, the user can either reclaim the tape so the data is preserved onto another cartridge within the same pool. If the data on the cartridge is no longer needed then the user must delete all files on disk that have been premigrated/migrated to the cartridge and run the `eeadm tape unassign` command with the `-E` option. After the tape has been removed from the pool using the `eeadm tape unassign -E` command add the tape to the new pool using the `eeadm tape assign` command with the `-f` option to force a format.

### 7.18 Reusing non-LTFS tape cartridges

In some scenarios, you might want to reuse tape cartridges for your IBM Spectrum Archive EE setup, which were used before as non-LTFS formatted media in another server setup behind your tape library (such as backup tape cartridges from a Tivoli Storage Manager Server or an IBM Spectrum Protect environment).

Although these tape cartridges still might contain data from the previous usage, they can be used within IBM Spectrum Archive EE the same way as new, unused tape cartridges. For more information about how to add new tape cartridge media to an IBM Spectrum Archive EE tape cartridge pool, see 6.8.1, “Adding tape cartridges” on page 132.

### 7.19 Moving tape cartridges between pools

This section describes preferred practices to consider when you want to move a tape cartridge between tape cartridge pools. This information also relates to the function that is described in 6.8.2, “Moving tape cartridges” on page 135.

#### 7.19.1 Avoiding changing assignments for tape cartridges that contain files

If a tape cartridge contains any files, a preferred practice is to not move the tape cartridge from one tape cartridge pool to another tape cartridge pool. If you remove the tape cartridge from one tape cartridge pool and then add it to another tape cartridge pool, the tape cartridge includes files that are targeted for multiple pools.
Before you export files you want from that tape cartridge, you must recall any files that are not supposed to be exported in such a scenario.

For more information, see 6.9, “Tape storage pool management” on page 140.

### 7.19.2 Reclaiming a tape cartridge and changing its assignment

Before you remove a tape cartridge from one tape cartridge pool and add it to another tape cartridge pool, a preferred practice is to reclaim the tape cartridge so that no files remain on the tape cartridge when it is removed. This action prevents the scenario that is described in 7.19.1, “Avoiding changing assignments for tape cartridges that contain files” on page 226.

For more information, see 6.9, “Tape storage pool management” on page 140 and 6.17, “Reclamation” on page 174.

### 7.20 Offline tape cartridges

This section describes how you can help maintain the file integrity of offline tape cartridges by not modifying the files of offline exported tape cartridges. Also, a reference to information about solving import problems that are caused by modified offline tape cartridges is provided.

#### 7.20.1 Do not modify the files of offline tape cartridges

When a tape cartridge is offline and outside the library, do not modify its IBM Spectrum Scale offline files on disk and do not modify its files on the tape cartridge. Otherwise, some files that exist on the tape cartridge might become unavailable to IBM Spectrum Scale.

#### 7.20.2 Solving problems

For more information about solving problems that are caused by trying to import an offline exported tape cartridge that was modified while it was outside the library, see “Importing offline tape cartridges” on page 178.

### 7.21 Scheduling reconciliation and reclamation

This section provides information about scheduling regular reconciliation and reclamation activities.

The reconciliation process resolves any inconsistencies that develop between files in the IBM Spectrum Scale and their equivalents in LTFS. The reclamation function frees up tape cartridge space that is occupied by non-referenced files and non-referenced content that is present on the tape cartridge. In other words, this is inactive content of data, but still occupying space on the physical tape.

It is preferable to schedule periodic reconciliation and reclamation, ideally during off-peak hours and at a frequency that is most effective. A schedule helps ensure consistency between files and efficient use of the tape cartridges in your IBM Spectrum Archive EE environment.

For more information, see 6.15, “Recalling files to their resident state” on page 171 and 6.17, “Reclamation” on page 174.
7.22 License Expiration Handling

License validation is done by the IBM Spectrum Archive EE program. If the license covers only a certain period (as in the case for the IBM Spectrum Archive EE Trial Version, which is available for three months), it expires if this time is passed. The behavior of IBM Spectrum Archive EE changes after that period in the following cases:

- The state of the nodes changes to the following defined value:
  
  NODE_STATUS_LICENSE_EXPIRED

  The node status can be determined through an internal node command, which is also used in other parts of IBM Spectrum Archive EE.

- When the license is expired, IBM Spectrum Archive EE can still read data, but it is impossible to write and migrate data. In such a case, not all IBM Spectrum Archive EE commands are usable.

When the license is expired and detected by the scheduler of the main IBM Spectrum Archive EE management components (MMM), it shuts down. This feature is necessary to have a proper clean-up if some jobs are still running or unscheduled. By doing so, a user is aware that IBM Spectrum Archive EE does not function because of the license expiration.

To give a user the possibility to access files that were previously migrated to tape, it is possible for IBM Spectrum Archive EE to restart, but it operates with limited functions. All functions that write to tape cartridges are not available. During the start of IBM Spectrum Archive EE (through MMM), it is detected that some nodes have the status of NODE_STATUS_LICENSE_EXPIRED.

IBM Spectrum Archive EE fails the following commands immediately:

- migrate
- import
- export
- reconcile
- reclaim

These commands are designed to write to a tape cartridge in certain cases. Therefore, they fail with an error message. The transparent access of a migrated file is not affected. The deletion of the link and the data file on a tape cartridge because of a write or truncate recall is omitted.

In summary, the following steps occur after expiration:

1. The status of the nodes changes to the state NODE_STATUS_LICENSE_EXPIRED.
2. IBM Spectrum Archive EE shuts down to allow a proper clean-up.
3. IBM Spectrum Archive EE can be started again with limited functions.

7.23 Disaster recovery

This section describes the preparation of an IBM Spectrum Archive EE DR setup and the steps that you must perform before and after a disaster to recover your IBM Spectrum Archive EE environment.
7.23.1 Tiers of disaster recovery

Understanding DR strategies and solutions can be complex. To help categorize the various solutions and their characteristics (for example, costs, recovery time capabilities, and recovery point capabilities), definitions of the various levels and required components can be defined. The idea behind such a classification is to help those concerned with DR to determine the following issues:

- What solution they have
- What solution they require
- What it requires to meet greater DR objectives

In 1992, the SHARE user group in the United States, along with IBM, defined a set of DR tier levels. This action was done to address the need to describe and quantify various different methodologies for successful mission-critical computer systems DR implementations. So, within the IT Business Continuance industry, the tier concept continues to be used, and is useful for describing today’s DR capabilities.

The tiers' definitions are designed so that emerging DR technologies can also be applied, as listed in Table 7-1.

<table>
<thead>
<tr>
<th>Tier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Zero data loss</td>
</tr>
<tr>
<td>5</td>
<td>Two-site two-phase commit</td>
</tr>
<tr>
<td>4</td>
<td>Electronic vaulting to hotsite (active secondary site)</td>
</tr>
<tr>
<td>3</td>
<td>Electronic vaulting</td>
</tr>
<tr>
<td>2</td>
<td>Offsite vaulting with a hotsite (PTAM + hot site)</td>
</tr>
<tr>
<td>1</td>
<td>Offsite vaulting (Pickup Truck Access Method (PTAM))</td>
</tr>
<tr>
<td>0</td>
<td>Offsite vaulting (PTAM)</td>
</tr>
</tbody>
</table>

In the context of the IBM Spectrum Archive EE product, this section focuses only on the tier 1 strategy because this is the only supported solution that you can achieve with a product that handles physical tape media (offsite vaulting).

For more information about the other DR tiers and general strategies, see Disaster Recovery Strategies with Tivoli Storage Management, SG24-6844.

**Tier 1: Offsite vaulting**

A tier 1 installation is defined as having a disaster recovery plan (DRP) that backs up and stores its data at an offsite storage facility, and determines some recovery requirements. As shown in Figure 7-1 on page 230, backups are taken that are stored at an offsite storage facility.

This environment can also establish a backup platform, although it does not have a site at which to restore its data, nor the necessary hardware on which to restore the data, such as compatible tape devices.
Because vaulting and retrieval of data is typically handled by couriers, this tier is described as the PTAM. PTAM is a method that is used by many sites because this is a relatively inexpensive option. However, it can be difficult to manage because it is difficult to know exactly where the data is at any point.

There is probably only selectively saved data. Certain requirements were determined and documented in a contingency plan and there is optional backup hardware and a backup facility that is available. Recovery depends on when hardware can be supplied, or possibly when a building for the new infrastructure can be located and prepared.

Although some customers are on this tier and seemingly can recover if there is a disaster, one factor that is sometimes overlooked is the recovery time objective (RTO). For example, although it is possible to recover data eventually, it might take several days or weeks. An outage of business data for this long can affect business operations for several months or even years (if not permanently).

**Important:** With IBM Spectrum Archive EE, the recovery time can be improved because after the import of the vaulting tape cartridges into a recovered production environment, the user data is immediately accessible without the need to copy back content from the tape cartridges into a disk or file system.

### 7.23.2 Preparing IBM Spectrum Archive EE for a tier 1 disaster recovery strategy (offsite vaulting)

IBM Spectrum Archive EE has all the tools and functions that you need to prepare a tier 1 DR strategy for offsite vaulting of tape media.

The fundamental concept is based on the IBM Spectrum Archive EE function to create replicas and redundant copies of your file system data to tape media during migration (see 6.11.4, “Replicas and redundant copies” on page 155). IBM Spectrum Archive EE enables the creation of a replica plus two more redundant replicas (copies) of each IBM Spectrum Scale file during the migration process.

The first replica is the primary copy, and other replicas are called redundant copies. Redundant copies must be created in tape cartridge pools that are different from the tape cartridge pool of the primary replica and different from the tape cartridge pools of other redundant copies.

Up to two redundant copies can be created, which means that a specific file from the GPFS file system can be stored on three different physical tape cartridges in three different IBM Spectrum Archive EE tape cartridge pools.
The tape cartridge where the primary replica is stored and the tapes that contain the redundant copies are referenced in the IBM Spectrum Scale inode with an IBM Spectrum Archive EE DMAPI attribute. The primary replica is always listed first.

Redundant copies are written to their corresponding tape cartridges in the IBM Spectrum Archive EE format. These tape cartridges can be reconciled, exported, reclaimed, or imported by using the same commands and procedures that are used for standard migration without replica creation.

Redundant copies must be created in tape cartridge pools that are different from the pool of the primary replica and different from the pools of other redundant copies. Therefore, create a DR pool named DRPool that exclusively contains the media you plan to Offline Export for offline vaulting. You must also plan for the following issues:

- Which file system data is migrated (as another replica) to the DR pool?
- How often do you plan to export and remove of physical tapes for offline vaulting?
- How do you handle media lifecycle management with the tape cartridges for offline vaulting?
- What are the DR steps and procedure?

If the primary replica of the IBM Spectrum Archive EE server and IBM Spectrum Scale do not exist due to a disaster, the redundant copy that is created and stored in an external site (offline vaulting) will be used for the disaster recovery.

Section 7.23.3, “IBM Spectrum Archive EE tier 1 DR procedure” on page 232 describes the steps that are used to perform these actions:

- Recover (import) the offline vaulting tape cartridges to a newly installed IBM Spectrum Archive EE environment
- Re-create the GPFS file system information
- Regain access to your IBM Spectrum Archive EE data

**Important:** The migration of a pre-migrated file does not create new replicas.

Example 7-20 shows you a sample migration policy to migrate all files to three pools. To have this policy run periodically, see “Using a cron job” on page 154.

**Example 7-20   Sample of a migration policy**

```plaintext
define(user_exclude_list,(PATH_NAME LIKE '/ibm/gpfs/.ltfsee/%' OR PATH_NAME LIKE '/ibm/gpfs/.SpaceMan/%'))
define(is_premigrated,(MISC_ATTRIBUTES LIKE '%M%' AND MISC_ATTRIBUTES NOT LIKE '%V%'))
define(is_migrated,(MISC_ATTRIBUTES LIKE '%V%'))
define(is_resident,(NOT MISC_ATTRIBUTES LIKE '%M%'))

RULE 'SYSTEM_POOL_PLACEMENT_RULE' SET POOL 'system'
RULE EXTERNAL POOL 'LTFSEE_FILES'
EXEC '/opt/ibm/ltfsee/bin/eeadm'
OPTS '-p primary@lib_ltfseevm copy@lib_ltfseevm DR@lib_ltfseevm'
SIZE(20971520)

RULE 'LTFSEE_FILES_RULE' MIGRATE FROM POOL 'system'
```
After you create redundant replicas of your file system data on different IBM Spectrum Archive EE tape cartridge pools for offline vaulting, you can Normal Export the tape cartridges by running the IBM Spectrum Archive EE `export` command. For more information, see 6.19.2, “Exporting tape cartridges” on page 178.

**Important:** The IBM Spectrum Archive EE `export` command does not eject the tape cartridge to the physical I/O station of the attached tape library. To eject the DR tape cartridges from the library to take them out for offline vaulting, you can run the `eeadm tape move` command with the option `-L ieslot`. For more information, see 6.8, “Tape library management” on page 132 and 10.1, “Command-line reference” on page 282.

### 7.23.3 IBM Spectrum Archive EE tier 1 DR procedure

To perform a DR to restore an IBM Spectrum Archive EE server and IBM Spectrum Scale with tape cartridges from offline vaulting, complete the following steps:

1. Before you start a DR, a set of IBM Spectrum Archive EE exported tape cartridges for an Offline vault must be created. In addition, a “new” Linux server and an IBM Spectrum Archive EE cluster environment, including IBM Spectrum Scale, must be set up.
2. Confirm that the new installed IBM Spectrum Archive EE cluster is running and ready for the import operation by running the following commands:
   - `# eeadm node list`
   - `# eeadm tape list`
   - `# eeadm pool list`
3. Insert the tape cartridges for DR into the tape library I/O station.
4. Use your tape library management GUI to assign the DR tape cartridges to the IBM Spectrum Archive EE logical tape library partition of your new IBM Spectrum Archive EE server.
5. From the IBM Spectrum Archive EE program, retrieve the updated inventory information from the logical tape library by running the following command:
   ```
   # eeadm library rescan
   ```
6. Import the DR tape cartridges into the IBM Spectrum Archive EE environment by running the `eeadm tape import` command. The `eeadm tape import` command features various options that you can specify. Therefore, it is important to become familiar with these options, especially when you are performing DR. For more information, see Chapter 10, “Reference” on page 281.

When you rebuild from one or more tape cartridges, the `eeadm tape import` command adds the specified tape cartridge to the IBM Spectrum Archive EE library and imports the files on that tape cartridge into the IBM Spectrum Scale namespace.

This process puts the stub file back in to the IBM Spectrum Scale namespace, but the imported files stay in a migrated state, which means that the data remains on tape. The data portion of the file is not copied to disk during the import.
Restoring file system objects and files from tape

If a GPFS file system fails, the migrated files and the saved file system objects (empty regular files, symbolic links, and empty directories) can be restored from tapes by running the `eadm tape import` command.

The `eadm tape import` command reinstantiates the stub files in IBM Spectrum Scale for migrated files. The state of those files changes to the `migrated` state. Also, the `eadm tape import` command re-creates the file system objects in IBM Spectrum Scale for saved file system objects.

**Note:** When a symbolic link is saved to tape and then restored by the `eadm tape import` command, the target of the symbolic link is kept. However, this process might cause the link to break. Therefore, after a symbolic link is restored, it might need to be moved manually to its original location on IBM Spectrum Scale.

**Recovery procedure by using the `eadm tape import` command**

Here is a typical user scenario for recovering migrated files and saved file system objects from tape by running the `eadm tape import` command:

1. Re-create the GPFS file system or create a GPFS file system.
2. Restore the migrated files and saved file system objects from tape by running the `eadm tape import` command:

   ```
   eadm tape import LTFS01L6 LTFS02L6 LTFS03L6 -p PrimPool -P
   /gpfs/ltfsee/rebuild
   
   /gpfs/ltfsee/rebuild is a directory in IBM Spectrum Scale to be restored to, PrimPool is the storage pool to import the tapes into, and LTFS01L6, LTFS02L6, and LTFS02L6 are tapes that contain migrated files or saved file system objects.
   ```

**Import processing for unexported tapes that are not reconciled**

The `eadm tape import` command might encounter tapes that are not reconciled when the command is applied to tapes that are not exported from IBM Spectrum Archive EE. In this case, the following situations can occur with the processing to restore files and file system objects, and should be handled as described for each case:

- The tapes might have multiple generations of a file or a file system object. If so, the `eadm tape import` command restores an object from the latest one that is on the tapes that are specified by the command.
- The tapes might not reflect the latest file information from IBM Spectrum Scale. If so, the `eadm tape import` command restores files or file system objects that were removed from IBM Spectrum Scale.

**Rebuild and restore considerations**

While the `eadm tape import` command is running, do not modify or access the files or file system objects to be restored. During the rebuild process, an old generation of the file can appear on IBM Spectrum Scale.

For more information about the `eadm tape import` command, see “Importing” on page 177.
7.24 IBM Spectrum Archive EE problem determination

If you discover an error message or a problem while you are running and operating the IBM Spectrum Archive EE program, you can check the IBM Spectrum Archive EE log file as a starting point for problem determination.

The IBM Spectrum Archive EE log file can be found in the following directory:

/var/log/ltfsee.log

In Example 7-21, we attempted to migrate two files (document10.txt and document20.txt) to a pool (myfirstpool) that contained two new formatted and added physical tapes (055AGWL5 and 055AGWL5). We encountered an error that only one file was migrated successfully. We checked the ltfsee.log to determine why the other file was not migrated.

Example 7-21 Check the ltfsee.log file

[root@mikasa1 gpfs]# eeadm migrate mig -p myfirstpool@lib_saitama
2019-01-21 08:37:54 GLESL700I: Task migrate was created successfully, task id is 7217.  
2019-01-21 08:37:55 GLESM096I: Starting the stage 1 of 3 for migration task 7217 (qualifying the state of migration candidate files).  
2019-01-21 08:37:55 GLESM097I: Starting the stage 2 of 3 for migration task 7217 (copying the files to 1 pools).  
2019-01-21 08:38:36 GLESM098I: Starting the stage 3 of 3 for migration task 7217 (changing the state of files on disk).  
2019-01-21 08:38:36 GLESL159E: Not all migration has been successful.  
2019-01-21 08:38:36 GLESL038I: Migration result: 1succeeded, 1 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.

[root@ltfs97 gpfs]#  
[root@ltfs97 gpfs]# vi /var/log/ltfsee.log
2019-01-21T08:37:55.399423-07:00 saitama2 mmm[22236]: GLESM148E(00704): File /ibm/gpfs/document20.txt is already migrated and will be skipped.  
2019-01-21T08:36.694378-07:00 saitama2 mmm[22236]: GLESL159E(00142): Not all migration has been successful.

In Example 7-21, you can see from the message in the IBM Spectrum Archive EE log file that one file we tried to migrate was already in a migrated state and therefore skipped to migrate again, as shown in the following example:

2019-01-21T08:37:55.399423-07:00 saitama2 mmm[22236]: GLESM148E(00704): File /ibm/gpfs/document20.txt is already migrated and will be skipped.

For more information about problem determination, see Chapter 9, “Troubleshooting” on page 259.

7.25 Collecting IBM Spectrum Archive EE logs for support

If you discover a problem with your IBM Spectrum Archive EE program and open a ticket at the IBM Support Center, you might be asked to provide a package of IBM Spectrum Archive EE log files.

A Linux script is available with IBM Spectrum Archive EE that collects all of the needed files and logs for your convenience to provide them to IBM Support. This task also compresses the files into a single package.
To generate the compressed .tar file and provide it on request to IBM Support, run the following command:

`ltfsee_log_collection`

Example 7-22 shows the output of the `ltfsee_log_collection` command. During the log collection run, you are asked what information you want to collect. If you are unsure, select Y to select all the information. At the end of the output, you can find the file name and where the log package was stored.

**Example 7-22  The ltfsee_log_collection command**

```
[root@kyoto ~]# ltfsee_log_collection
```

IBM Spectrum Archive Enterprise Edition - log collection program

This program collects the following information from your IBM Spectrum Scale (GPFS) cluster.

1. Log files that are generated by IBM Spectrum Scale (GPFS), and IBM Spectrum Archive EE
2. Configuration information that is configured to use IBM Spectrum Scale (GPFS)
   and IBM Spectrum Archive EE.
3. System information including
   - OS distribution and kernel information,
   - hardware information (CPU and memory) and
   - process information (list of running processes).
4. Task information files under the following subdirectory
   `<GPFS mount point>/ltfsee/statesave`

If you agree to collect all the information, input 'y'.
If you agree to collect only (1) and (2), input 'p' (partial).
If you agree to collect only (4) task information files, input 't'.
If you don't agree to collect any information, input 'n'.

The following files are collected only if they were modified within the last 90 days.

- /var/log/messages*
- /var/log/ltfsee.log*
- /var/log/ltfsee_trc.log*
- /var/log/ltfsee_mon.log*
- /var/log/ltfs.log*
- /var/log/ltfsee_install.log
- /var/log/ltfsee_stat_drivereperf.log*
- /var/log/httpd/error_log*
- /var/log/httpd/rest_log*
- /var/log/ltfsee_rest/rest_app.log*
- /var/log/logstash/*

You can collect all of the above files, including files modified within the last 90 days, with an argument of 'all'.

`#/ltfsee_log_collection all`

If you want to collect the above files that were modified within the last 30 days.

`#/ltfsee_log_collection 30`

The collected data will be zipped in the `ltfsee_log_files_<date>_<time>.tar.gz` file.
You can check the contents of the file before submitting it to IBM.

Input > y
Creating a temporary directory '/root/ltfsee_log_files'...
The collection of local log files is in progress.

Removing collected files...
Information has been collected and archived into the following file.
ltfsee_log_files_20190121_084618.tar.gz

7.26 Backing up files within file systems that are managed by IBM Spectrum Archive EE

The Tivoli Storage Manager Backup/Archive client and the Tivoli Storage Manager hierarchical storage management (HSM) client from the IBM Spectrum Protect family are components of IBM Spectrum Archive EE and are installed as part of the IBM Spectrum Archive EE installation process. Therefore, it is possible to use them to back up files within the GPFS or IBM Spectrum Scale file systems. The mmbackup command can be used to back up some or all of the files of a GPFS or IBM Spectrum Scale file system to IBM Spectrum Protect servers using the IBM Spectrum Protect Backup-Archive client. After files have been backed up, you can restore them using the interfaces provided by IBM Spectrum Protect.

The mmbackup command utilizes all the scalable, parallel processing capabilities of the mmapplypolicy command to scan the file system, evaluate the metadata of all the objects in the file system, and determine which files need to be sent to backup in IBM Spectrum Protect, as well which deleted files should be expired from IBM Spectrum Protect. Both backup and expiration take place when running mmbackup in the incremental backup mode.

The mmbackup command can inter-operate with regular IBM Spectrum Protect commands for backup and expire operations. However if after using mmbackup, any IBM Spectrum Protect incremental or selective backup or expire commands are used, mmbackup needs to be informed of these activities. Use either the -q option or the --rebuild option in the next mmbackup command invocation to enable mmbackup to rebuild its shadow databases.

These databases shadow the inventory of objects in IBM Spectrum Protect so that only new changes will be backed up in the next incremental mmbackup. Failing to do so will needlessly back up some files again. The shadow database can also become out of date if mmbackup fails due to certain IBM Spectrum Protect server problems that prevent mmbackup from properly updating its shadow database after a backup. In these cases it is also required to issue the next mmbackup command with either the -q option or the --rebuild options.

The mmbackup command provides the following benefits:

- A full backup of all files in the specified scope.
- An incremental backup of only those files that have changed or been deleted since the last backup. Files that have changed since the last backup are updated and files that have been deleted since the last backup are expired from the IBM Spectrum Protect server.
- Utilization of a fast scan technology for improved performance.
- The ability to perform the backup operation on a number of nodes in parallel.
- Multiple tuning parameters to allow more control over each backup.
- The ability to backup the read/write version of the file system or specific global snapshots.
- Storage of the files in the backup server under their GPFS root directory path independent of whether backing up from a global snapshot or the live file system.
- Handling of unlinked filesets to avoid inadvertent expiration of files.

For more information, see IBM Knowledge Center.

7.26.1 Considerations

Consider the following points when you are using the Tivoli Storage Manager Backup/Archive client in the IBM Spectrum Archive EE environment:

- IBM Spectrum Protect requirements for backup
- Update the dsm.sys and dsm.opt files to support both IBM Spectrum Protect and IBM Spectrum Archive EE operations
- Ensure the files are backed up first with IBM Spectrum Protect followed by archiving the files with IBM Spectrum Archive EE to avoid recall storms

7.26.2 Backing up a GPFS or IBM Spectrum Scale environment

The best practice is to always backup the files using IBM Spectrum Protect first and then archiving the files using IBM Spectrum Archive EE. The primary reason is that attempting to back up the stub of a file that was migrated to IBM Spectrum Archive EE causes it to be automatically recalled from LTFS (tape) to the IBM Spectrum Scale. This is not an efficient way to perform backups, especially when you are dealing with large numbers of files.

The `mmbackup` command is used to back up the files of a GPFS or IBM Spectrum Scale file system to Tivoli Storage Manager servers by using the Tivoli Storage Manager Backup/Archive Client of the IBM Spectrum Protect family. In addition, the `mmbackup` command can operate with regular Tivoli Storage Manager backup commands for backup. After a file system is backed up, you can restore files by using the interfaces that are provided by Tivoli Storage Manager of the IBM Spectrum Protect family.

Starting with IBM Spectrum Archive EE v1.3.0.0 and IBM Spectrum Scale v5.0.2.2, a new option has been added to the `eeadm migrate` command called `--mmbackup`. With the `--mmbackup` option is supplied, IBM Spectrum Archive EE will first verify that current backup versions of the files exist within IBM Spectrum Protect before it will archive them to IBM Spectrum Archive EE. If those files are not backed up, those files will be filtered out and thus not archived to tape. This ensures that there will be no recall storm due to the backup of files.

The `--mmbackup` option of the `eeadm migrate` command takes 1 option, which is the location of the mmbackup shadow database. This location is normally the same device or directory option of the `mmbackup` command.
In some use cases where IBM Spectrum Archive EE is deployed, you might have the requirement to periodically ensure that the files and data that is migrated from the IBM Spectrum Scale file system to physical tape is still readable and can be recalled back from tape to the file system without any error. Especially in a more long-term archival environment, a function that checks the physical media based on a schedule that the user can implement is highly appreciated.

Starting with the release of the IBM TS4500 Tape Library R2, a new, fully transparent function is introduced within the TS4500 operations that is named policy-based automatic media verification. This new function is hidden from any ISV software, similar to the automatic cleaning.

No ISV certification is required. It can be enabled/disabled through the logical library with more settings to define the verify period (for example, every 6 months) and the first verification date.

One or more designated media verification drives (MVDs) must be assigned to a logical library in order for the verification to take place. A preferred practice is to have two MVDs assigned at a time to ensure that no false positives occur because of a faulty tape drive. Figure 7-2 shows an example of such a setup.

**Note:** MVDs defined within a logical library are not accessible from the host or application by using the drives of this particular logical library for production.
Verify that results are simple pass/fail, but verify that failures are retried on a second physical drive, if available, before being reported. A failure is reported through all normal notification options (email, syslog, and SNMP). MVDs are not reported as mount points (SCSI DTEs) to the ISV application, so MVDs do not need to be connected to the SAN.

During this process, whenever access from the application or host is required to the physical media under media verification, the tape library stops the current verification process. It then dismounts the needed tape from the MVD, and mounts it to a regular tape drive within the same logical library for access by the host application to satisfy the requested mount. At a later point, the media verification process continues.

The library GUI Cartridges page adds columns for last verification date/time, verification result, and next verification date/time (if automatic media verification is enabled). If a cartridge being verified is requested for ejection or mounting by the ISV software (which thinks the cartridge is in a storage slot), the verify task is automatically canceled, a checkpoint occurs, and the task resumes later (if/when the cartridge is available).

The ISV eject or mount occurs with a delay comparable to a mount to a drive being cleaned (well within the preferred practice SCSI Move Medium timeout values). The GUI also supports a manual stop of the verify task.

The last verification date/time is written in the cartridge memory (CM) and read upon first mount after being newly inserted into a TS4500, providing persistence and portability (similar to a cleaning cartridge usage count).

All verify mounts are recorded in the mount history CSV file, allowing for more granular health analysis (for example, outlier recovered error counts) by using Tape System Reporter (TSR) or Rocket Server graph.

The whole media verification process is transparent to IBM Spectrum Archive EE as the host. No definitions and configurations need to be done within IBM Spectrum Archive EE. All setup activities are done only through the TS4500 management interface.
Figure 7-3 - Figure 7-6 on page 241 are examples from the TS4500 tape library web interface that show you how to assign an MVD to a logical library. It is a two-step process because you must define a drive to be an MVD and then assign this drive before the logical library (if it was not assigned before). Complete the following steps:

1. Select the menu option **Drives by Logical Library** to assign an unassigned drive to a logical library by right-clicking the unassigned drive icon. A menu opens where you select **Assign**, as shown in Figure 7-3.

![Assign a tape drive to a logical library through the TS4500 web interface (step 1)](image)

2. Another window opens where you must select the specific logical library to which the unassigned drive is supposed to be added, as shown in Figure 7-4.

![Assign a tape drive to a logical library through the TS4500 web interface (step 2)](image)
3. If the drive to be used as an MVD is configured within the logical library, change its role, as shown in Figure 7-5 and Figure 7-6 on page 241.

![Figure 7-5 Reserve a tape drive as the media verification drive through the TS4500 web interface](image1)

4. You must right-click the assigned drive within the logical library. A menu opens and you select **Use for Media Verification** from the list of the provided options. A confirmation dialog box opens. Click **Yes** to proceed.

5. After making that configuration change to the drive, you see a new icon in front of it to show you the new role (Figure 7-6).

![Figure 7-6 Display a tape drive as the media verification drive through the TS4500 web interface](image2)

**Note:** The MVD flag for a tape drive is a global setting, which means that after it is assigned, the drive keeps its role as an MVD even if it is unassigned and then assigned to a new logical library. Unassigning does not disable this role.

To unassign a drive from being an MVD, follow the same procedure again, and select (after the right-click) **Use for Media Access**. This action changes the drive role back to normal operation for the attached host application to this logical library.
Figure 7-7 shows you the TS4500 web interface dialog box for enabling automatic media verification on an existing logical library. You must go to the Cartridges by Logical Library page. Then, select **Modify Media Verification** for the selected logical library. The Automatic Media Verification dialog box opens where you can enter the media verification schedule.

![Modify Media Verification dialog box](image)

*Figure 7-7  Modify Media Verification dialog box to set up a schedule*

By using this dialog box, you can enable/disable an automatic media verification schedule. Then, you can configure how often the media should be verified and the first verification date. Finally, you can select the MVDs, which are selected by the library to perform the scheduled media verification test.

If you go to the Cartridges by Logical Library page and select **Properties** for the selected logical library, a dialog box opens where you can see the current media verification configuration for that logical library, as shown by Figure 7-8.

![Properties for Logical Library](image)

*Figure 7-8  TS4500 properties for a logical library*
7.28 How to disable transparent recall and IBM Spectrum Archive EE commands

A transparent recall and some IBM Spectrum Archive EE commands can be disabled or enabled.

The control is done by disabling or enabling corresponding task types by using the `eeadm cluster set` command. The commands, corresponding task types, and corresponding attribute names that are used by the `eeadm cluster set` command are listed in Table 7-2.

**Table 7-2 eeadm cluster set commands, task types, and attribute names**

<table>
<thead>
<tr>
<th>File access or eeadm command</th>
<th>Task type</th>
<th>Attribute name</th>
</tr>
</thead>
<tbody>
<tr>
<td>File access that would trigger a recall</td>
<td>transparent_recall</td>
<td>allow_transparent_recall</td>
</tr>
<tr>
<td>eeadm migrate</td>
<td>migrate</td>
<td>allow_migrate</td>
</tr>
<tr>
<td>eeadm premigrate</td>
<td>premigrate</td>
<td>allow_premigrate</td>
</tr>
<tr>
<td>eeadm recall</td>
<td>selective_recall</td>
<td>allow_selective_recall</td>
</tr>
<tr>
<td>eeadm save</td>
<td>save</td>
<td>allow_save</td>
</tr>
</tbody>
</table>

The attributes can be set to “yes” or “no” by using the `eeadm cluster set` command. The current setting can be verified by using the `eeadm cluster show` command.

When a task type is disabled, the next command immediately fails. The failed task can be verified by using the `eeadm task list -c` command and the `eeadm task show` command.

Example 7-23 shows the results of the `eeadm cluster show` and `eeadm task show` commands when the `allow_transparent_recall` option is set to no.

**Example 7-23 Disabling transparent recall**

```
[root@server dir1]# eeadm cluster set -a allow_transparent_recall -v no  

[root@server dir1]# eeadm cluster show  
Attribute Value  
allow_transparent_recall no  
allow_selective_recall yes  
allow_migrate yes  
allow_premigrate yes  
allow_save yes

[root@server dir1]# cat file2  
cat: file2: Permission denied
```
```bash
[root@server dir1]# eeadm task show 1622

=== Task Information ===
Task ID:              1622
Task Type:            transparent_recall
Command Parameters:   dsmrecall
Status:               completed
Result:               failed
Accepted Time:        Thu Nov 14 21:40:34 2019 (+0900)
Started Time:         Thu Nov 14 21:40:34 2019 (+0900)
Completed Time:       Thu Nov 14 21:40:34 2019 (+0900)
Workload:             7 bytes of file (name: /ibm/gpfs0/archive/dir1/file2, inode: 215804)
Progress:             -
Result Summary:       Disabled
```
Use cases

This chapter describes various use case examples for IBM Spectrum Archive EE.

This chapter includes the following topics:

- 8.1, “Use cases overview” on page 246
- 8.2, “Oil and Gas” on page 249
- 8.3, “Media and Entertainment” on page 250
- 8.4, “Media and Entertainment” on page 251
- 8.5, “Healthcare” on page 252
- 8.6, “Genomics” on page 253
- 8.7, “Archive of Research/Scientific Data for Long Periods of Time” on page 254
- 8.8, “University Scientific Data Archive” on page 255
- 8.9, “AFM use cases” on page 256
8.1 Use cases overview

The typical use cases for IBM Spectrum Archive EE can be broken into three categories: Archive, tiered storage, and data exchange, as shown in Figure 8-1.

<table>
<thead>
<tr>
<th>Archive</th>
<th>Tiered storage</th>
<th>Data exchange</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Archive large volumes of data and files</td>
<td>- Policy based placement and migration</td>
<td>- Exchange large volumes of data</td>
</tr>
<tr>
<td>- Retain data for long periods of time</td>
<td>- Use tape for infrequently accessed files</td>
<td>- Provide access via global namespace</td>
</tr>
<tr>
<td>- Unlikely to be recalled</td>
<td></td>
<td></td>
</tr>
<tr>
<td><img src="image" alt="Leverage simplicity and tape TCO" /></td>
<td></td>
<td><img src="image" alt="Leverage import and export functions, copy function, and standardized format" /></td>
</tr>
</tbody>
</table>

Figure 8-1   Typical use cases for IBM Spectrum Archive EE

For more information about each use case, see Figure 8-2, Figure 8-3 on page 247, and Figure 8-4 on page 248.

8.1.1 Use case for archive

Figure 8-2 summarizes the requirements, solution, and benefits of an IBM Spectrum Archive EE use case for archiving data.

![Use case for archive](image)

Some of the requirements for the archive use case are:

- Large amount of data, larger files
- Infrequently accessed
- Longer retention periods
- Easy data access

The solution is based on archive storage that is based on IBM Spectrum Scale, IBM Spectrum Archive EE, and standard file system interfaces.
Some of the archive use case benefits are:

- Simplicity with file system interface
- Scalable with IBM Spectrum Scale and IBM Spectrum Archive EE
- Low TCO with IBM tape

### 8.1.2 Use case for tiered and scalable storage

Figure 8-3 summarizes the requirements, solution, and benefits of an IBM Spectrum Archive EE use case for tiered and scalable storage.

Some of the requirements for the tiered and scalable use case are:

- Archive to file systems
- Simple backup solution
- Easy data access for restore

The solution is based on archive storage that is based on IBM Spectrum Scale, IBM Spectrum Archive EE, and standard file system interfaces

Some of the tiered and scalable use case benefits are:

- Easy to use with standard copy tools
- Scalable with IBM Spectrum Scale and IBM Spectrum Archive EE
- Low TCO with IBM tape
8.1.3 Use case data exchange

Figure 8-4 summarizes the requirements, solution, and benefits of an IBM Spectrum Archive EE use case for data exchange.

Some of the requirements for the data exchange use case are:
- Export entire directories to tape
- Import files and directories with seamless data access
- Leverage global name space

The solution is based on IBM Spectrum Scale, IBM Spectrum Archive EE, and standard file system interfaces using export and import functions

Some of the data exchange use case benefits are:
- Export of tape copies
- Efficient import without reading data
- Import and export within global namespace
8.2 Oil and Gas

An Oil and Gas managed service provider collects offshore seismic data for analysis. The solution uses the leading technology based on IBM Power Linux, IBM Spectrum Scale, and IBM Spectrum Archive EE as a seismic data repository. The seismic data is collected from vessels. The technology for both acquisition and processing of seismic data has evolved dramatically over time. Today, a modern seismic vessel typically generates 4-5 TBs of new raw data per day, which once processed will generate 10 to 100 times more data in different formats.

For data that needs to be online but not accessed very frequently, tape is by far more attractive than spinning disk. Hybrid storage solutions with automated and policy-driven movement of data between different storage tiers including tape is required for such large data repositories. Figure 8-5 shows an IBM Spectrum Archive Oil and Gas archive use case.

A video of every leading Managed Service Provider in the Nordics with thousands of servers using tape as an integral part of their seismic data management is available at this website.
8.3 Media and Entertainment

As visual effects get more sophisticated, the computational demands of media and entertainment rose sharply. In response, Pixit Media became the UK’s leading provider of post-production software-defined solutions that are based on IBM Spectrum Storage technology, which provides reliable performance and cost-efficiency to support blockbuster growth.

Their business challenge is to keep audiences spellbound with their output. Media and Entertainment companies must share, store, and access huge files that traditional infrastructure solutions are failing to deliver. To meet this transformation, Pixit Media put consistent performance and chart-topping scalability in the limelight through software-defined solutions that are based on IBM Spectrum Storage technology that helps clients create hit after hit.

Figure 8-6 shows how a studio’s workflow and applications can talk to IBM Spectrum Scale, which is backed by industry-standard servers and disk arrays that serve as the global single namespace file system.

![Figure 8-6 Pixit Media workflow using IBM Spectrum Scale](image)

Pixit Media also began offering solutions that are based on IBM Spectrum Archive EE. They commented that:

“Most of our clients have complex requirements when it comes to archiving a project. They want to move it to a reliable media on a project-by-project basis but without having to manually manage the library. IBM Spectrum Archive EE can offer these customers a worry-free, centralized approach to managing this process, which can be set up in just two or three days and scale out extremely quickly.”

---

1 https://www.ibm.com/case-studies/pixit-media-systems-spectrum
8.4 Media and Entertainment

The customer is the nation’s premier regional sports network providing a unique and special experiences for local sports fans, sponsors, teams, and media partners across 4 different regions of the United States. All production and post production videos are stored on high-speed storage. However many of these post production videos will never be accessed again so there is no need to occupy space on the high-speed storage. The customer will migrate these post production videos to tape using IBM Spectrum Archive EE.

If the post production videos are ever needed again, they can transparently be recalled back to the high-speed storage. The user data files can be viewed as a normal file system to the Media Asset Management (MAM) system while providing a seamless integration into existing environments. The mission is to preserve these assets and provide rapid access. Figure 8-7 shows an IBM Spectrum Archive use case for media and entertainment.
8.5 Healthcare

Amsterdam University Medical Center (UMC), location VUmc is enabling ground breaking research with scalable, cost-effective storage for big data. With its storage requirements skyrocketing that must be kept for decades, they needed to reevaluate its infrastructure to continue conducting cutting-edge research in a secure and cost-effective way. Working with a partner, the medical center helped researchers migrate from NAS drives to a centralized storage platform that is based on IBM Spectrum Storage solutions.

With IBM Spectrum Scale and IBM Spectrum Archive EE solutions at the heart of its centralized storage environment, Amsterdam UMC, location, VUmc supports its clinicians, researchers, and administrators with the resources they need to work effectively. The promise was to deliver a solution with which users can find the exact data they were looking for easily and quickly, when and where they need it, and without disruptions.

Now the solution helps to achieve 99% faster data migrations, which enables IT to focus on value-added development. The centralized data architecture ensures VUmc can fully support its clinicians, researchers, and administrators with the resources they need to accelerate discoveries and conduct innovative research.

For more information, see this IBM Support web page.
8.6 Genomics

The customer is one of the largest genomics research facilities in North America, integrating sequencing, bioinformatics, data management, and genomics research. Their mission is to deliver analysis to support personalized treatment to individual cancer patients where the Standard of Care has failed. Hundreds of PBs of data has been moved from old filers to the IBM Spectrum Archive EE system, at a rate of 1.2 PB per month to tape. 2 sets of tape storage pools are used to be able to exchange/share the data with a remote education institute.

The software engineers have also optimized the recall of massive genomics data for their researchers, allowing for quick access to TBs of their migrated genomics data. Figure 8-8 shows a high-level archive for a genomics data archive.

Figure 8-8  IBM Spectrum Archive use case for genomics data archive
8.7 Archive of Research/Scientific Data for Long Periods of Time

This research institute routinely manages large volumes of data generated internally and collected by other institutes. To support its ongoing projects, the institute must archive and store the data for many years. However, because most of the data is infrequently accessed, the research institute was looking for a cost-efficient archiving solution that would allow transparent user access.

In addition, the research institute needed a solution that would facilitate the fast import and export of large data volumes. Figure 8-9 shows the high-level architecture to archive research and scientific data for long periods.

Figure 8-9 also shows the redundancy of the archive data from the backup solution. Both archive and backup solutions are storing data on lower cost tape storage. The copies are in two independent systems offering more options for stricter data security requirements.
8.8 University Scientific Data Archive

This university specializes in transportation research. This solution was designed to meet the long-term storage needs of the scientific research community, the university refers to it as “Scientific Data Archive”. Scientific research frequently gathers data that need to be available for subsequent dissemination, follow-on research studies, compliance or review of provenance, and other purposes, sometimes with commitment to maintain these data sets for decades.

The proposed solution will be a storage system residing in two locations, providing network access to multiple organizational units within the university, each with their own respective permission models. The primary objective of the Scientific Data Archive is to provide cost-effective, resilient, long-term storage for research data and supporting research computing infrastructure. The archive will be a storage facility operated the university’s Storage Management Team, in cooperation with other units on campus. This facility will deliver service to research organizations on campus. Figure 8-10 show the architecture for the university’s archive.

Figure 8-10 IBM Spectrum Archive use case for university Scientific Data Archive
8.9 AFM use cases

This section covers the use of a home and cache sites, and delves into two typical use cases of IBM Spectrum Archive EE with IBM Spectrum Scale AFM explaining the Centralized Archive Repository scenario and the Asynchronous Archive Replication scenario.

Active file management (AFM) uses a home-and-cache model in which a single home provides the primary storage of data, and exported data is cached in a local GPFS file system:

**Home** A home site is an NFS export of a remote cluster. This export can be a local file system in the remote cluster, a GPFS file system, or a GPFS fileset in the remote cluster. AFM is supported when a remote file system is mounted on the cache cluster using GPFS protocols. This configuration requires that a multicluster setup exists between the home and cache before AFM can use the home cluster’s file system mount for AFM operations.

**Cache** A cache site is a remote cluster with a GPFS fileset that has a mount point to the exported NFS file system of the home cluster’s file system. A cache site uses a proprietary protocol over NFS. Each AFM-enabled fileset has a single home cluster associated with it (represented by the host name of the home server).

8.9.1 Centralized Archive Repository

In an environment where data needs to be allocated together to create a bigger picture, archiving, or for disaster recovery planning, users can make a Centralized Archive Repository. A Centralized Archive Repository uses a single home cluster that can have multiple NFS exports to many cache sites.

In this setup, IBM Spectrum Archive EE is configured on the home cluster to archive all the data generated from each cache cluster. The idea behind this solution is to have a single home repository that has a large disk space, and multiple cache sites that cannot afford large disk space.

**Note:** AFM supports multiple cache modes, and this solution can be used with single writer or independent writer. However, with the release of IBM Spectrum Archive EE v1.2.3.0, only the independent writer is currently supported.

When files are generated on the cache clusters, they are asynchronously replicated to the home site. When these files are no longer being accessed on the cache clusters, the files can be evicted, freeing up disk space at the cache clusters. They can then be migrated onto tape at the home cluster. If evicted files need to be accessed again at the cache clusters, they can simply be recovered by opening the file for access or by using AFM’s prefetch operation to retrieve multiple files back to disk from the home site.
Figure 8-11 shows a configuration of a single home cluster with multiple cache clusters to form a Centralized Archive Repository.

Some examples of customers who can benefit from this solution are research groups that are spread out geographically and rely on each group’s data, such as universities. Medical groups and media companies can also benefit.

### 8.9.2 Asynchronous Archive Replication

Asynchronous Archive Replication is an extension to the stretched cluster configuration. In it, users require the data created is replicated to a secondary site and can be migrated to tape at both sites. By incorporating IBM Spectrum Scale AFM to the stretched cluster idea, there are no limits on how far away the secondary site is located. In addition to geolocation capabilities, data created on home or cache is asynchronously replicated to the other site.

Asynchronous Archive Replication requires two remote clusters configured, one being the home cluster and the other being a cache cluster with the independent writer mode. By using the independent writer mode in this configuration, users can create files at either site and the data/metadata is asynchronously replicated to the other site.
Note: With independent writer, the cache site always wins during file modifications. If files are created at home, only metadata is transferred to the cache at the next update or refresh. To obtain the file's data from the home site at the cache site, use AFM’s prefetch operation to get the data or open specific files. The data is then propagated to the cache nodes.

Figure 8-12 shows a configuration of an Asynchronous Archive Replication solution between a home and cache site.
Troubleshooting

This chapter describes the process that you can use to troubleshoot issues with IBM Spectrum Archive EE.

This chapter includes the following topics:

- 9.1, “Overview” on page 260
- 9.2, “Hardware” on page 263
- 9.3, “Recovering data from a write failure tape” on page 267
- 9.4, “Recovering data from a read failure tape” on page 268
- 9.5, “Software” on page 269
- 9.6, “Recovering from system failures” on page 278
9.1 Overview

This section provides a simple health check procedure for IBM Spectrum Archive EE.

9.1.1 Quick health check

If you are having issues with an existing IBM Spectrum Archive EE environment, Figure 9-1 shows a simple flowchart that you can follow as the first step to troubleshooting problems with the IBM Spectrum Archive EE components.

![Quick health check procedure](image)

If your issue remains after you perform these simple checks, follow the procedures that are described in the remainder of this chapter to perform more detailed troubleshooting. If the problem cannot be resolved, contact IBM Spectrum Archive Support.

9.1.2 Common startup errors

IBM Spectrum Archive EE has multiple components it manages and requires to have a successful start before the system is ready for use. In addition for its own components multiple external components must be running and configured properly for IBM Spectrum Archive EE to have a proper startup. This section will walk through some of these components and the common startup errors that effect IBM Spectrum Archive EE from starting up correctly.

After running `eemadm cluster start` and the returned status code is error, IBM Spectrum Archive EE failed to start correctly and user actions are required to remedy the situation. To view the type of error that has occurred during startup and which node(s) are affected run the `eemadm node list` command.
Failed startup caused by rpcbind

The `rpcbind` utility is required for MMM to function correctly, if `rpcbind` is not running IBM Spectrum Archive EE will start up with errors and will be unusable until the issue has been resolved. In most cases this is caused when `rpcbind` is not started up. If the server had been recently powered down for maintenance and was started back up `rpcbind` might not start up automatically.

Example 9-1 shows the output of a failed IBM Spectrum Archive EE startup due to `rpcbind` not running.

**Example 9-1   rpcbind caused startup failure**

```
[root@tora ~]# eeadm cluster start
Library name: lib_tora, library serial: 0000013FA002040C, control node (ltfsee_md)
IP address: 9.11.244.63.
Starting - sending a startup request to lib_tora.
Starting - waiting for startup completion : lib_tora.
Starting - opening a communication channel : lib_tora.
Starting - waiting for getting ready to operate : lib_tora.

2019-01-21 09:04:17 GLESL657E: Fail to start the IBM Spectrum Archive EE service
(MMM) for library lib_tora.
Use the "eeadm node list" command to see the error modules.
The monitor daemon will start the recovery sequence.
```

```
[root@tora ~]# eeadm node list
Spectrum Archive EE service (MMM) for library lib_tora fails to start or is not running on tora.tuc.stglabs.ibm.com Node ID:1

Problem Detected:
Node ID  Error Modules
1  MMM; rpcbind;
```

To remedy this issue use the `systemctl start rpcbind` command to start the process up, and either wait for the IBM Spectrum Archive EE Monitor daemon to start up MMM or issue a `eeadm cluster stop` and `eeadm cluster start` to get the MMM started. After `rpcbind` is started, it can be verified by running the `systemctl status rpcbind` to see if it is running.

Example 9-2 shows how to startup `rpcbind` and waiting for the Monitor daemon to restart MMM.

**Example 9-2   Starting rpcbind to remedy MMM startup failure**

```
[root@tora ~]# systemctl start rpcbind
[root@tora ~]# systemctl status rpcbind
? rpcbind.service - RPC bind service
   Loaded: loaded (/usr/lib/systemd/system/rpcbind.service; disabled; vendor preset: enabled)
   Active: active (running) since Mon 2019-01-21 09:08:37 MST; 1min 12s ago
     Process: 23628 ExecStart=/sbin/rpcbind -w $RPCBIND_ARGS (code=exited, status=0/SUCCESS)
     Main PID: 23629 (rpcbind)
   Tasks: 1
```

Chapter 9. Troubleshooting   261
Failed startup caused by LE

LE is another crucial component to IBM Spectrum Archive EE. If it is not started up correctly, MMM does not start. There are two common startup problems that can be remedied quickly. The first problem is caused by no drive visibility by the Spectrum Archive EE node. This problem can be fixed by connecting fibre channel cables to the node and verified by running the `ltfs -o device_list` command.

Example 9-3 shows the output of `ltfs -o device_list` with no drives connected.

Example 9-3   No drives connected to server

```
[root@tora ~]# ltfs -o device_list
6b6c LTFS14000I LTFS starting, LTFS version 2.4.1.0 (10219), log level 2.
6b6c LTFS14058I LTFS Format Specification version 2.4.0.
6b6c LTFS14104I Launched by "/opt/IBM/ltfs/bin/ltfs -o device_list".
6b6c LTFS14105I This binary is built for Linux (x86_64).
6b6c LTFS14106I GCC version is 4.8.3 20140911 (Red Hat 4.8.3-9).
6b6c LTFS17087I Kernel version: Linux version 3.10.0-862.14.4.el7.x86_64
   (mockbuild@x86-040.build.eng.bos.redhat.com) (gcc version 4.8.5 20150623 (Red Hat 4.8.5-28) (GCC) ) #1 SMP Fri Sep 21 09:07:21 UTC 2018 i386.
6b6c LTFS17089I Distribution: NAME="Red Hat Enterprise Linux Server".
6b6c LTFS17089I Distribution: Red Hat Enterprise Linux Server release 7.5 (Maipo).
6b6c LTFS17089I Distribution: Red Hat Enterprise Linux Server release 7.5 (Maipo).
6b6c LTFS17085I Plugin: Loading "sg" changer backend.
6b6c LTFS17085I Plugin: Loading "sg" tape backend.
Changer Device list:. Tape Device list:.
```

The second most common LE error is caused after connecting the drives to the IBM Spectrum Archive EE node and forgetting to set at least one of the drives a control path drive from the library GUI. IBM Spectrum Archive EE requires at least one control path drive so it can communicate with the library.

Example 9-4 shows the output of a failed IBM Spectrum Archive EE start up that is caused by LE.

Example 9-4   LE failed MMM startup

```
[root@tora ~]# eeadm cluster start
Library name: lib_tora, library serial: 0000013FA002040C, control node (ltfsee_md)
IP address: 9.11.244.63.
Starting - sending a startup request to lib_tora.
Starting - waiting for startup completion : lib_tora.
Starting - opening a communication channel : lib_tora.
```
Starting - waiting for getting ready to operate : lib_tora.

... 2019-01-21 09:24:33 GLESL657E: Fail to start the IBM Spectrum Archive EE service (MMM) for library lib_tora. Use the "eadm node list" command to see the error modules. The monitor daemon will start the recovery sequence.

[root@tora ~]# eadm node list

Spectrum Archive EE service (MMM) for library lib_tora fails to start or is not running on tora.tuc.stglabs.ibm.com Node ID:1

Problem Detected:
Node ID  Error Modules
        1  LE; MMM;

To remedy this failure, ensure that the node can see its drives and at least one drive is a control path drive.

9.2 Hardware

This section provides information that can help you to identify and resolve problems with the hardware that is used by IBM Spectrum Archive EE.

9.2.1 Tape library

If the TS4500 tape library has a problem, it reports an error in the events page on the TS4500 Management GUI. When an error occurs, IBM Spectrum Archive might not work. Figure 9-2 shows an example of a library error.

![Figure 9-2 Tape library error log](image)

For more information about how to solve tape library errors, see the IBM TS4500 R4 Tape Library Guide, SG24-8235.

9.2.2 Tape drives

If an LTO tape drive has a problem, it reports the error on a single-character display (SCD). If a TS1140 (or later) tape drive has a problem, it reports the error on an 8-character message display. When this error occurs, IBM Spectrum Archive might not work. To obtain information about a drive error, determine which drive is reporting the error and then access the events page to see the error by using the TS4500 Management GUI.
Figure 9-3 shows an example from the web interface of a tape drive that has an error and is no longer responding.

If you right-click the event and select **Display fix procedure**, another window opens and shows suggestions about how to fix the problem. If a drive display reports a specific drive error code, see the tape drive maintenance manual for a solution. For more information about analyzing the operating system error logs, see 9.5.1, “Linux” on page 269.

If a problem is identified in the tape drive and the tape drive must be repaired, the drive must first be removed from the IBM Spectrum Archive EE system. For more information, see “Taking a tape drive offline” on page 265.

**Managing tape drive dump files**

This section describes how to manage the automatic erasure of drive dump files. IBM Spectrum Archive automatically generates two tape drive dump files in the `/tmp` directory when it receives unexpected sense data from a tape drive. Example 9-5 shows the format of the dump files.

```
Example 9-5   Dump files
[root@ltfs97 tmp]# ls -la *.dmp
-rw-r--r-- 1 root root 3681832 Apr  4 14:26 ltfs_1068000073_2013_0404_142634.dmp
-rw-r--r-- 1 root root 3681832 Apr  4 14:42 ltfs_1068000073_2013_0404_144212.dmp
-rw-r--r-- 1 root root 3697944 Apr  4 14:42 ltfs_1068000073_2013_0404_144212_f.dmp
-rw-r--r-- 1 root root 3697944 Apr  4 15:45 ltfs_1068000073_2013_0404_154524.dmp
-rw-r--r-- 1 root root 3683424 Apr  4 15:45 ltfs_1068000073_2013_0404_154524_f.dmp
-rw-r--r-- 1 root root 3683424 Apr  4 17:21 ltfs_1068000073_2013_0404_172124.dmp
-rw-r--r-- 1 root root 3721684 Apr  4 17:21 ltfs_1068000073_2013_0404_172124_f.dmp
-rw-r--r-- 1 root root 3721684 Apr  4 17:21 ltfs_1068000073_2013_0404_172140.dmp
-rw-r--r-- 1 root root 3792168 Apr  4 17:21 ltfs_1068000073_2013_0404_172140_f.dmp
```

The size of each drive dump file is approximately 2 MB. By managing the drive dump files that are generated, you can save disk space and enhance IBM Spectrum Archive performance.
It is not necessary to keep dump files after they are used for problem analysis. Likewise, the files are not necessary if the problems are minor and can be ignored. A script program that is provided with IBM Spectrum Archive EE periodically checks the number of drive dump files and their date and time. If some of the dump files are older than two weeks or if the number of dump files exceeds 1000 files, the script program erases them.

The script file is started by using Linux crontab features. A cron ltfs_limit_dumps.sh file is in the /etc/cron.daily directory. This script file is started daily by the Linux operating system. The interval to run the script can be changed by moving the cron_ltfs_limit_dumps.sh file to other cron folders, such as cron.weekly. For more information about how to change the crontab setting, see the manual for your version of Linux.

In the cron ltfs_limit_dumps.sh file, the automatic drive dump erase policy is specified by the option of the ltfs_limit_dump.sh script file, as shown in the following example:

```
/opt/IBM/ltfs/bin/ltfs_limit_dumps.sh -t 14 -n 1000
```

You can modify the policy by editing the options in the cron_ltfs_limit_dumps.sh file. The expiration date is set as a number of days by the -t option. In the example, a drive dump file is erased when it is more than 14 days old. The number of files to keep is set by the -n option. In our example, if the number of files exceeds 1,000, older files are erased so that the 1,000-file maximum is not exceeded. If either of the options are deleted, the dump files are deleted by the remaining policy.

By editing these options in the cron_ltfs_limit_dumps.sh file, the number of days that files are kept and the number of files that are stored can be modified.

Although not recommended, you can disable the automatic erasure of drive dump files by removing the cron_ltfs_limit_dumps.sh file from the cron folder.

**Taking a tape drive offline**

This section describes how to take a drive offline from the IBM Spectrum Archive EE system to perform diagnostic operations while the IBM Spectrum Archive EE system stays operational. To accomplish this task, use software such as the IBM Tape Diagnostic Tool (ITDT) or the IBM LTFS Format Verifier, which are described in 10.3, “System calls and IBM tools” on page 292.

**Important:** If the diagnostic operation you intend to perform requires that a tape cartridge be loaded into the drive, ensure that you have an empty non-pool tape cartridge available in the logical library of IBM Spectrum Archive EE. If a tape cartridge is in the tape drive when the drive is removed, the tape cartridge is automatically moved to the home slot.

To perform diagnostic tests, complete the following steps:

1. Identify the node ID number of the drive to be taken offline by running the eeadm drive list command. Example 9-6 shows the tape drives in use by IBM Spectrum Archive EE.

```
[root@tora ~]# eeadm drive list
```

<table>
<thead>
<tr>
<th>Drive S/N</th>
<th>State</th>
<th>Type</th>
<th>Role</th>
<th>Library</th>
<th>Node ID</th>
<th>Tape</th>
<th>Node Group</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task ID</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>0000000014A00</td>
<td>not_mounted</td>
<td>TS1160</td>
<td>mrg</td>
<td>lib_tora</td>
<td>1</td>
<td>-</td>
<td>G0</td>
</tr>
<tr>
<td>00000078PG20C</td>
<td>not_mounted</td>
<td>TS1160</td>
<td>mrg</td>
<td>lib_tora</td>
<td>1</td>
<td>-</td>
<td>G0</td>
</tr>
</tbody>
</table>

*Example 9-6 Identify the tape drive to remove*
In this example, we take the tape drive with serial number 000000014A00 on cluster node 1 offline.

2. Remove the tape drive from the IBM Spectrum Archive EE inventory by specifying the `eeadm drive unassign <drive serial number>` command. Example 9-7 shows the removal of a single tape drive from IBM Spectrum Archive EE.

Example 9-7  Remove the tape drive

```
[root@tora ~]# eeadm drive unassign 000000014A00
2019-01-22 13:26:45 GLESL700I: Task drive_unassign was created successfully, task id is 6432.
2019-01-22 13:26:51 GLESL121I: Drive serial 000000014A00 is removed from the tape drive list.
2019-01-22 13:36:49 GLESL121I: Drive serial 000000014A00 is removed from the tape drive list.
```

3. Check the success of the removal. Run the `eeadm drive list` command and verify that the output shows that the MMM attribute for the drive is in the `stock` state. Example 9-8 shows the status of the drives after it is removed from IBM Spectrum Archive EE.

Example 9-8  Check the tape drive status

```
[root@tora ~]# eeadm drive list
Drive S/N     State        Type    Role  Library   Node ID  Tape  Node Group  Task ID
0000078PG20C  not_mounted  TS1160   mrg  lib_tora  1        -     G0          -
000000014A00 unassigned   -        ---  lib_tora  -        -     -           -
```

4. Identify the primary device number of the drive for subsequent operations by running the `/opt/ibm/ltfsle/bin/ltfs -o device_list` command. The command outputs a list of available drives. Example 9-9 shows the output of this command.

Example 9-9  `ltfs -o device_list` command output

```
[root@tora ~]# /opt/ibm/ltfsle/bin/ltfs -o device_list
77d1 LTFS14000I LTFS starting, LTFS version 2.4.1.1 (10226), log level 2.
77d1 LTFS14058I LTFS Format Specification version 2.4.0.
77d1 LTFS14104I Launched by "/opt/IBM/ltfs/bin/ltfs -o device_list".
77d1 LTFS14105I This binary is built for Linux (x86_64).
77d1 LTFS14106I GCC version is 4.8.3 20140911 (Red Hat 4.8.3-9).
77d1 LTFS17087I Kernel version: Linux version 3.10.0-862.14.4.el7.x86_64
(mockbuild@x86-040.build.eng.bos.redhat.com) (gcc version 4.8.5 20150623 (Red Hat 4.8.5-28) (GCC) ) #1 SMP Fri Sep 21 09:07:21 UTC 2018 i386.
77d1 LTFS17089I Distribution: NAME="Red Hat Enterprise Linux Server".
77d1 LTFS17089I Distribution: Red Hat Enterprise Linux Server release 7.5 (Maipo).
77d1 LTFS17089I Distribution: Red Hat Enterprise Linux Server release 7.5 (Maipo).
77d1 LTFS17085I Plugin: Loading "sg" changer backend.
77d1 LTFS17085I Plugin: Loading "sg" tape backend.
Changer Device list:.
Device Name = /dev/sg11, Vender ID = IBM    , Product ID = 03584L22       ,
Serial Number = 00000013FA002040C, Product Name = TS3500/TS4500.
Tape Device list:.
Device Name = /dev/sg1, Vender ID = IBM    , Product ID = 0359260F        ,
Serial Number = 0000078PG20C, Product Name =[0359260F].
```
Device Name = /dev/sg0, Vender ID = IBM, Product ID = 0359260F, Serial Number = 0000078PG20D, Product Name = [0359260F].

5. If your diagnostic operations require a tape cartridge to be loaded into the drive, complete the following steps. Otherwise, you are ready to perform diagnostic operations on the drive, which has the drive address /dev/sgnumber, where number is the device number that is obtained in step 4:
   a. Move the tape cartridge to the drive from the I/O station or home slot. You can move the tape cartridge by using ITDT (in which case the drive must have the control path), or the TS4500 Management GUI.
   b. Perform the diagnostic operations on the drive, which has the drive address /dev/sgnumber, where number is the device number that is obtained in step 4.
   c. When you are finished, return the tape cartridge to its original location.

6. Add the drive to the IBM Spectrum Archive EE inventory again by running the `eeadm drive assign drive_serial -n node_id` command, where `node_id` is the same node that the drive was assigned to originally in step 1 on page 265.

Example 9-10 shows the tape drive that is readded to IBM Spectrum Archive EE.

```
Example 9-10 Add again the tape drive
[root@tora ~]# eeadm drive assign 000000014A00 -n 1
```

Running the `eeadm drive list` command again shows that the tape drive is no longer in a “stock” state. Example 9-11 shows the output of this command.

```
Example 9-11 Check the tape drive status
[root@tora ~]# eeadm drive list
Drive S/N     State        Type    Role  Library   Node ID  Tape  Node Group  Task ID
000000014A00  not_mounted  TS1160   mrg  lib_tora  1        -     G0          -
0000078PG20C  not_mounted  TS1160   mrg  lib_tora  1        -     G0          -
```

9.3 Recovering data from a write failure tape

A tape that suffers from a write failure goes into a `require_replace` state. Complete the following steps to recover data from a `require_replace` tape:

1. Verify that the tape is in the `require_replace` state by running `eeadm tape list`.
2. Verify there is a tape cartridge in the appendable state within the same cartridge pool which has enough available space to hold the data from the `require_replace` tape.
3. Run `eeadm tape replace` command on the `require_replace` tape to start the data transfer process onto an appendable tape within the same pool.

Example 9-12 shows the commands and output to replace a `require_replace` tape.

```
Example 9-12 Replacing data from a require_replace tape
[root@ginza prod]# eeadm tape list | grep pool1
FC0254L8  degraded  require_replace        10907          0               0
          0%  pool1  liba     homeslot  -
```

Chapter 9. Troubleshooting 267
A tape that suffers from a read failure goes into a need_replace state. Complete the following steps to copy migrated jobs from a need_replace tape to a valid tape within the same pool:

1. Identify a tape with a read failure by running `eeadm tape list` to locate the need_replace tape.

2. Verify there is an appendable tape within the same pool which has enough available space to hold the data from the need_replace tape cartridge.

3. Run the `eeadm tape replace` command to start the data transfer process onto an appendable tape within the same pool.

Example 9-13 shows system output of the steps to recover data from a read failure tape.

```
[root@ginza prod]# eeadm tape list | grep pool1
FC0254L8 degraded require_replace 10907 0 0
0% pool1 liba homeslot -

[root@ginza prod]# eeadm tape replace FC0254L8 -p pool1
2019-02-05 14:49:03 GLESL700I: Task tape_replace was created successfully, task id is 2319.
2019-02-05 14:49:03 GLESL755I: Start a reconcile before starting a replace against 1 tapes.
2019-02-05 14:51:46 GLESS002I: Reconciling tape FC0254L8 complete.
2019-02-05 14:51:49 GLESL756I: Reconcile before replace finished.
2019-02-05 14:55:03 GLESL749I: The tape replace operation for FC0254L8 is successful.

[root@ginza prod]# eeadm tape list | grep pool1
FC0257L8 ok appendable 10907 0 10907
0% pool1 liba drive -
```

9.4 Recovering data from a read failure tape

Example 9-13 shows system output of the steps to recover data from a read failure tape.

```
[root@hakone prod3]# eeadm tape list | grep test1
IM1229L6 ok appendable 2242 0 2242
0% test1 liba homeslot -
IM1195L6 info need_replace 2242 0 0
0% test1 liba drive -

[root@hakone prod3]# eeadm tape replace IM1195L6 -p test1
2019-02-26 14:29:27 GLESL700I: Task tape_replace was created successfully, task id is 1297.
2019-02-26 14:30:05 GLESS002I: Reconciling tape IM1195L6 complete.
```

Example 9-13  Recovering data from a read failure
9.5 Software

IBM Spectrum Archive EE is composed of four major components, each with its own set of log files. Therefore, problem analysis is slightly more involved than other products. This section describes troubleshooting issues with each component in turn and the Linux operating system and Simple Network Management Protocol (SNMP) alerts.

9.5.1 Linux

The log file `/var/log/messages` contains global LINUX system messages, including the messages that are logged during system start and messages that are related to LTFS and IBM Spectrum Archive EE functions. However, three specific log files are also created:

- `ltfs.log`
- `ltfsee.log`
- `ltfsee_trc.log`

Unlike with previous LTFS/IBM Spectrum Archive products, there is no need to enable the system logging on Linux because it is automatically performed during the installation process. Example 9-14 shows the changes to the `rsyslog.conf` file and the location of the two log files.

**Example 9-14  The rsyslog.conf file**

```
[root@ltfssn1 ~]# cat /etc/rsyslog.conf | grep ltfs
:msg, startswith, "GLES," /var/log/ltfsee_trc.log;gles_trc_template
:msg, startswith, "GLES" /var/log/ltfsee.log;RSYSLOG_FileFormat
:msg, regex, "LTFS\[ID0-9\][0-9]*\[E\W\]\]" /var/log/ltfs.log;RSYSLOG_FileFormat
```

By default, after the `ltfs.log`, `ltfsee.log`, and `ltfsee_trc.log` files reach 1 MB, they are rotated and four copies are kept. Example 9-15 shows the log file rotation settings. These settings can be adjusted as needed within the `/etc/logrotate.d/syslog` control file.

**Example 9-15  Syslog rotation**

```
[root@ltfssn1 ~]# cat /etc/logrotate.d/syslog
/var/log/cron
/var/log/maillog
/var/log/messages
/var/log/secure
/var/log/spooler
{
    sharedscripts
    postrotate
    /bin/kill -HUP `cat /var/run/syslogd.pid 2> /dev/null` 2> /dev/null || true
    endscript
}
/var/log/ltfs.log {
    size 1M
```
These log files (ltfs.log, ltfsee.log, ltfsee_trc.log, and /var/log/messages) are invaluable in troubleshooting LTFS messages. The ltfsee.log file contains only warning and error messages. Therefore, it is easy to start looking here for the reasons of failure. For example, a typical file migration might return the information message that is shown in Example 9-16.

Example 9-16  Simple migration with informational messages

[root@ginza prod]# eeadm migrate mig -p pool2
2019-02-07 18:15:07 GLESL700I: Task migrate was created successfully, task id is 2326.
2019-02-07 18:15:08 GLESM896I: Starting the stage 1 of 3 for migration task 2326 (qualifying the state of migration candidate files).
2019-02-07 18:15:08 GLESM897I: Starting the stage 2 of 3 for migration task 2326 (copying the files to 1 pools).
2019-02-07 18:15:08 GLESM898I: Starting the stage 3 of 3 for migration task 2326 (changing the state of files on disk).
2019-02-07 18:15:08 GLESL159E: Not all migration has been successful.
2019-02-07 18:15:08 GLESL038I: Migration result: 0 succeeded, 100 failed, 0 duplicate, 0 duplicate wrong pool, 0 not found, 0 too small to qualify for migration, 0 too early for migration.
From the GLESL159E message, you know that the migration was unsuccessful, but you do not know why it was unsuccessful. To understand why, you must examine the ltfsee.log file. Example 9-17 shows the end of the ltfsee.log file immediately after the failed migrate command is run.

Example 9-17   The ltfsee.log file

```bash
# tail /var/log/ltfsee.log
2019-02-07T18:20:03.301978-07:00 ginza mmm[14807]: GLESM600E(00412): Failed to migrate/premigrate file /ibm/gpfs/prod/FILE1. The specified pool name does not match the existing replica copy.
2019-02-07T18:20:03.493810-07:00 ginza mmm[14807]: GLESL159E(00144): Not all migration has been successful.
```

In this case, the migration of the file was unsuccessful because it was previously migrated/premigrated to a different tape cartridge.

With IBM Spectrum Archive EE, there are two logging facilities. One is in a human-readable format that is monitored by users and the other is in machine-readable format that is used for further problem analysis. The former facility is logged in to /var/log/ltfsee.log through the “user” syslog facility and contains only warnings and errors. The latter facility is logged in to /var/log/ltfsee_trc.log through the “local2” Linux facility.

The messages in machine-readable format can be converted into human-readable format by the newly created tool ltfsee_catcsvlog, which is run by the following command:

```
/opt/ibm/ltfsee/bin/ltfsee_catcsvlog /var/log/ltfsee_trc.log
```

The ltfsee_catcsvlog command accepts multiple log files as command-line arguments. If no argument is specified, ltfsee_catcsvlog reads from stdin.

**Persistent problems**

This section describes ways to solve persistent IBM Spectrum Archive EE problems.

If an unexpected and persistent condition occurs in the IBM Spectrum Archive EE environment, contact your IBM service representative. Provide the following information to help IBM re-create and solve the problem:

- Machine type and model of your IBM tape library in use for IBM Spectrum Archive EE
- Machine type and model of the tape drives that are embedded in the tape library
- Specific IBM Spectrum Archive EE version
- Description of the problem
- System configuration
- Operation that was performed at the time the problem was encountered

The operating system automatically generates system log files after initial configuration of the IBM Spectrum Archive EE. Provide the results of the ltfsee_log_collection command to your IBM service representative.
9.5.2 IBM Spectrum Scale

IBM Spectrum Scale writes operational messages and error data to the IBM Spectrum Scale log file. The IBM Spectrum Scale log can be found in the /var/adm/ras directory on each node. The IBM Spectrum Scale log file is named mmfs.log.date.nodeName, where date is the time stamp when the instance of IBM Spectrum Scale started on the node and nodeName is the name of the node. The latest IBM Spectrum Scale log file can be found by using the symbolic file name /var/adm/ras/mmfs.log.latest.

The IBM Spectrum Scale log from the prior start of IBM Spectrum Scale can be found by using the symbolic file name /var/adm/ras/mmfs.log.previous. All other files have a time stamp and node name that is appended to the file name.

At IBM Spectrum Scale start, files that were not accessed during the last 10 days are deleted. If you want to save old files, copy them elsewhere.

Example 9-18 shows normal operational messages that appear in the IBM Spectrum Scale log file.

Example 9-18 Normal operational messages in an IBM Spectrum Scale log file

```
[root@ltfs97 ]# cat /var/adm/ras/mmfs.log.latest
Wed Apr  3 13:25:04 JST 2013: runmmfs starting
Removing old /var/adm/ras/mmfs.log.* files:
   Unloading modules from /lib/modules/2.6.32-220.el6.x86_64/extra

Wed Apr  3 13:25:07.409 2013: Node 192.168.208.97 (htohru9) is now the Group Leader.
Wed Apr  3 13:25:07.411 2013: This node (192.168.208.97 (htohru9)) is now Cluster Manager for htohru9.ltd.sdl.

Starting ADSM Space Management daemons
Wed Apr  3 13:25:17.907 2013: mmfsd ready
Wed Apr  3 13:25:18 JST 2013: mounting /dev/gpfs
Wed Apr  3 13:25:19.023 2013: Command: err 0: mount gpfs
Wed Apr  3 13:25:19 JST 2013: finished mounting /dev/gpfs
```

Depending on the size and complexity of your system configuration, the amount of time to start IBM Spectrum Scale varies. Taking your system configuration into consideration, if you cannot access a file system that is mounted (automatically or by running a mount command) after a reasonable amount of time, examine the log file for error messages.
The IBM Spectrum Scale log is a repository of error conditions that were detected on each node, and operational events, such as file system mounts. The IBM Spectrum Scale log is the first place to look when you are attempting to debug abnormal events. Because IBM Spectrum Scale is a cluster file system, events that occur on one node might affect system behavior on other nodes, and all IBM Spectrum Scale logs can have relevant data.

A common error that might appear when trying to mount GPFS is that it cannot read superblock. Example 9-19 shows the output of the error when trying to mount GPFS.

Example 9-19  Superblock error from mounting GPFS

```
[root@ltfsml1 ~]# mmmount gpfs
Wed May 24 12:53:59 MST 2017: mmmount: Mounting file systems ...
mount: gpfs: can't read superblock
mmmount: Command failed. Examine previous error messages to determine cause.
```

The cause of this error and failure to mount GPFS is that the GPFS file system had dmapi enabled, but the HSM process has not been started. To get around this error and successfully mount GPFS, issue the `systemctl start hsm` command, and make sure it is running by issuing `systemctl status hsm`. After HSM is running, wait for the recall processes to initiate. This process can be viewed by issuing `ps -afe | grep dsm`. Example 9-20 shows output of starting HSM, checking the status, and mounting GPFS.

Example 9-20  Starting HSM and mounting GPFS

```
[root@ltfsml1 ~]# systemctl start hsm
[root@ltfsml1 ~]# systemctl status hsm
? hsm.service - HSM Service
   Loaded: loaded (/usr/lib/systemd/system/hsm.service; enabled; vendor preset: disabled)
   Active: active (running) since Wed 2017-05-24 13:04:59 MST; 4s ago
   Main PID: 16938 (dsmwatchd)
   CGroup: /system.slice/hsm.service
          +16938 /opt/tivoli/tsm/client/hsm/bin/dsmwatchd nodetach
May 24 13:04:59 ltfsml1.tuc.stglabs.ibm.com systemd[1]: Starting HSM Service...
[root@ltfsml1 ~]# ps -afe | grep dsm
root 7906 1 0 12:56 ? 00:00:00
 /opt/tivoli/tsm/client/hsm/bin/dsmwatchd nodetach
root 9748 1 0 12:57 ? 00:00:00 dsmrecalld
root 9773 9748 0 12:57 ? 00:00:00 dsmrecalld
root 9774 9748 0 12:57 ? 00:00:00 dsmrecalld
root 9900 26012 0 12:57 pts/0 00:00:00 grep --color=auto dsm
[root@ltfsml1 ~]# mmmount gpfs
Wed May 24 12:57:22 MST 2017: mmmount: Mounting file systems ...
[root@ltfsml1 ~]# df -h | grep gpfs
gpfs 280G 154G 127G 55%
```

If HSM is already running, double check if the dsmrecalld daemons are running by issuing `ps -afe | grep dsm`. If no dsmrecalld daemons are running, start them by issuing `dsmmigfs start`. After they have been started, GPFS can be successfully mounted.
9.5.3 IBM Spectrum Archive LE component

This section describes the options that are available to analyze problems that are identified by the LTFS logs. It also provides links to messages and actions that can be used to troubleshoot the source of an error.

The messages that are referenced in this section provide possible actions only for solvable error codes. The error codes that are reported by LTFS program can be retrieved from the terminal console or log files. For more information about retrieving error messages, see 9.5.1, “Linux” on page 269.

When multiple errors are reported, LTFS attempts to find a message ID and an action for each error code. If you cannot locate a message ID or an action for a reported error code, LTFS encountered a critical problem. If you try an initial action again and continue to fail, LTFS also encountered a critical problem. In these cases, contact your IBM service representative for more support.

Message ID strings start with the keyword LTFS and are followed by a four- or five-digit value. However, some message IDs include the uppercase letter I or D after LTFS, but before the four- or five-digit value. When an IBM Spectrum Archive EE command is run and returns an error, check the message ID to ensure that you do not mistake the letter I for the numeral 1.

A complete list of all LTFS messages can be found in the IBM Spectrum Archive EE section of IBM Knowledge Center.

At the end of the message ID, the following single capital letters indicate the importance of the problem:

- E: Error
- W: Warning
- I: Information
- D: Debugging

When you troubleshoot, check messages for errors only.

Example 9-21 shows a problem analysis procedure for LTFS.

Example 9-21 LTFS messages

```
cat /var/log/ltfs.log
2019-02-07T18:33:04.663564-07:00 ginza ltfs[12251]: 478d LTFS14787I Formatting cartridge FC0252L8.
2019-02-07T18:33:42.724406-07:00 ginza ltfs[12251]: 478d LTFS14837I Formatting cartridge FC0252L8 (0x5e, 0x00).
2019-02-07T18:33:42.729350-07:00 ginza ltfs[12251]: 478d LTFS14789E Failed to format cartridge FC0252L8 (-1079).
2019-02-07T18:33:42.729543-07:00 ginza ltfs[12251]: 478d LTFSI1079E The operation is not allowed.
```

The set of 10 characters represents the message ID, and the text that follows describes the operational state of LTFS. The fourth message ID (LTFSI1079E) in this list indicates that an error was generated because the last character is the letter E. The character immediately following LTFS is the letter I. The complete message, including an explanation and appropriate course of action for LTFSI1079E, is shown in the following example: Example 9-22 on page 275.
Example 9-22  Example of message

LTFS14789E Failed to format cartridge FC0252L8 (-1079).
LTFS11079E The operation is not allowed.
The previous operation did not run due to tape and or drive issues.
In this case the drive and tape compatibility was incorrect.

Based on the description that is provided here, the tape cartridge in the library failed to format. Upon further investigation the tape cartridge and drive is incompatible. The required user action to solve the problem is to attach a compatible drive to the library and Spectrum Archive EE node and rerun the operation.

9.5.4 Hierarchical storage management

During installation, hierarchical storage management (HSM) is configured to write log entries to a log file in /opt/tivoli/tsm/client/hsm/bin/dsmerror.log. Example 9-23 shows an example of this file.

Example 9-23  The dsmerror.log file

[root@ltfs97 /]# cat dsmerror.log
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file1.img' could not be found.
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file2.img' could not be found.
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file3.img' could not be found.
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file4.img' could not be found.
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file5.img' could not be found.
03/29/2013 15:24:28 ANS9101E Migrated files matching '/ibm/glues/file6.img' could not be found.
04/02/2013 16:24:06 ANS9510E dsmrecalld: cannot get event messages from session 515A6F7E00000000, expected max message-length = 1024, returned message-length = 144. Reason : Stale NFS file handle
04/02/2013 16:24:06 ANS9474E dsmrecalld: Lost my session with errno: 1. Trying to recover.
04/02/2013 16:24:10 ANS9433E dsmwatchd: dm_send_msg failed with errno 1.
04/03/2013 13:25:06 ANS9505E dsmwatchd: cannot initialize the DMAPI interface. Reason: Stale NFS file handle
04/03/2013 13:38:14 ANS1079E No file specification entered
04/03/2013 13:38:20 ANS9085E dsmrecall: file system / is not managed by space management.

The HSM log contains information about file migration and recall, threshold migration, reconciliation, and starting and stopping the HSM daemon. You can analyze the HSM log to determine the current state of the system. For example, the logs can indicate when a recall has started but not finished within the last hour. The administrator can analyze a particular recall and react accordingly.

In addition, an HSM log might be analyzed by an administrator to optimize HSM usage. For example, if the HSM log indicates that 1,000 files are recalled at the same time, the administrator might suggest that the files can be first compressed into one .tar file and then migrated.

9.5.5 IBM Spectrum Archive EE logs

This section describes IBM Spectrum Archive EE logs and message IDs and provide some tips for dealing with failed recalls and missing files.
IBM Spectrum Archive EE log collection tool

IBM Spectrum Archive EE writes its logs to the files /var/log/ltfsee.log and /var/log/ltfsee_trc.log. These files can be viewed in a text editor for troubleshooting purposes. Use the IBM Spectrum Archive EE log collection tool to collect data that you can send to IBM Support.

The ltfsee_log_collection tool is in the /opt/ibm/ltfsee/bin folder. To use the tool, complete the following steps:

1. Log on to the operating system as the root user and open a console.
2. Start the tool by running the following command:
   
   ```
   # /opt/ibm/ltfsee/bin/ltfsee_log_collection
   ```

3. When the following message displays, read the instructions, then enter y or p to continue:

   LTFS Enterprise Edition - log collection program

   This program collects the following information from your GPFS cluster.

   a. Log files that are generated by GPFS, LTFS Enterprise Edition
   b. Configuration information that is configured to use GPFS and LTFS Enterprise Edition
   c. System information including OS distribution and kernel, and hardware information (CPU and memory)
   d. Task information files under the following subdirectory <GPFS mount point>/.ltfsee/statesave.

   If you want to collect all the information, enter y.
   If you want to collect only a and b, enter p (partial).
   If you agree to collect only (4) task information files, input 't'.
   If you do not want to collect any information, enter n.

   The collected data is compressed in the ltfsee_log_files_[date]_[time].tar.gz file.
   You can check the contents of the file before submitting it to IBM.

4. Make sure that a packed file with the name ltfsee_log_files_[date]_[time].tar.gz is created in the current directory. This file contains the collected log files.

5. Send the tar.gz file to your IBM service representative.

Messages reference

For IBM Spectrum Archive EE, message ID strings start with the keyword GLES and are followed by a single letter and then by a three-digit value. The single letter indicates which component generated the message. For example, GLESL is used to indicate all messages that are related to the IBM Spectrum Archive EE command. At the end of the message ID, the following single uppercase letter indicates the importance of the problem:

- E: Error
- W: Warning
- I: Information
- D: Debugging

When you troubleshoot, check messages for errors only. For a list of available messages, see IBM Knowledge Center.
Failed reconciliations
Failed reconciliations usually are indicated by the GLESS003E error message with the following description:

Reconciling tape %s failed due to a generic error.

File status
Table 9-1 lists the seven possible status codes for files in IBM Spectrum Archive EE. They can be viewed for individual files by running the eeadm file state command.

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resident</td>
<td>The resident status indicates that the file is resident in the GPFS namespace and is not saved, migrated, or premigrated to a tape.</td>
</tr>
<tr>
<td>migrated</td>
<td>The migrated status indicates that the file was migrated. The file was copied from GPFS file system to a tape, and exists only as a stub file in the GPFS namespace.</td>
</tr>
<tr>
<td>premigrated</td>
<td>The premigrated status indicates that the file was premigrated. The file was copied to a tape (or tapes), but the file was not removed from the GPFS namespace.</td>
</tr>
<tr>
<td>saved</td>
<td>The saved status indicates that the file system object that has no data (a symbolic link, an empty directory, or an empty regular file) was saved. The file system object was copied from GPFS file system to a tape.</td>
</tr>
<tr>
<td>offline</td>
<td>The offline status indicates that the file was saved or migrated to a tape cartridge and thereafter the tape cartridge was exported offline.</td>
</tr>
<tr>
<td>missing</td>
<td>The missing status indicates that a file has the migrated or premigrated status, but it is not accessible from IBM Spectrum Archive EE because the tape cartridge it is supposed to be on is not accessible. The file might be missing because of tape corruption or if the tape cartridge was removed from the system without exporting.</td>
</tr>
</tbody>
</table>

Files with the missing status are caused because of tape corruption or if the tape cartridge was removed from the system without exporting. If the cause is a corrupted index run the eeadm tape validate command, otherwise if the tape is missing from the tape library bring the tape back into the library and run the eeadm library rescan command.
9.6 Recovering from system failures

The system failures that are described in this section are the result of hardware failures or temporary outages that result in IBM Spectrum Archive EE errors.

9.6.1 Power failure

When a library power failure occurs, the data on the tape cartridge that is actively being written is probably left in an inconsistent state.

To recover a tape cartridge from a power failure, complete the following steps:
1. Create a mount point for the tape library. For more information, see the procedure described in 6.2.2, “IBM Spectrum Archive Library Edition component” on page 117.
2. If you do not know which tape cartridges are in use, try to access all tape cartridges in the library. If you do know which tape cartridges are in use, try to access the tape cartridge that was in use when the power failure occurred.
3. If a tape cartridge is damaged, it is identified as inconsistent and the corresponding subdirectories disappear from the file system. You can confirm which tape cartridges are damaged or inconsistent by running the eeadm tape list command. The list of tape cartridges that displays indicates the volume name, which is helpful in identifying the inconsistent tape cartridge. For more information, see 6.18, “Checking and repairing tapes” on page 175.
4. Recover the inconsistent tape cartridge by running the eeadm tape validate command. For more information, see 6.18, “Checking and repairing tapes” on page 175.

9.6.2 Mechanical failure

When a library receives an error message from one of its mechanical parts, the process to move a tape cartridge cannot be performed.

**Important:** A drive in the library normally performs well despite a failure so that ongoing access to an opened file on the loaded tape cartridge is not interrupted or damaged.

To recover a library from a mechanical failure, complete the following steps:
1. Identify the issue on the tape library.
2. Manually repair the gating part.
3. Run the eeadm tape validate command on each effected tape.
4. Follow the procedure that is described in 9.6.1, “Power failure” on page 278.

**Important:** One or more inconsistent tape cartridges might be found in the storage slots and might need to be made consistent by following the procedure that is described in “Unassigned state” on page 288.

9.6.3 Inventory failure

When a library cannot read the tape cartridge bar code for any reason, an inventory operation for the tape cartridge fails. The corresponding media folder does not display, but a specially designated folder that is named UNKN0000 is listed instead. This designation indicates that a tape cartridge is not recognized by the library.
If the user attempts to access the tape cartridge contents, the media folder is removed from the file system. The status of any library tape cartridge can be determined by running the `eemadm tape list` command. For more information, see 6.23, “Obtaining system resources, and tasks information” on page 189.

To recover from an inventory failure, complete the following steps:

1. Remove any unknown tape cartridges from the library by using the operator panel or Tape Library Specialist web interface, or by opening the door or magazine of the library.
2. Check all tape cartridge bar code labels.

   **Important:** If the bar code is removed or about to peel off, the library cannot read it. Replace the label or firmly attach the bar code to fix the problem.

3. Insert the tape cartridge into the I/O station.
4. Check to determine whether the tape cartridge is recognized by running the `eemadm tape list` command.
5. Add the tape cartridge to the LTFS inventory by running the `eemadm tape assign` command.

### 9.6.4 Abnormal termination

If LTFS terminates because of an abnormal condition, such as a system hang-up or after the user initiates a `kill` command, the tape cartridges in the library might remain in the tape drives. If this occurs, LTFS locks the tape cartridges in the drives and the following command is required to release them:

```
# ltfs release_device -o changer_devname=[device name]
```
Reference

This chapter describes the commands that are used to operate IBM Spectrum Archive EE, data, and metadata formats for IBM Spectrum Scale to IBM Spectrum Archive EE migrations, system calls, tools, and limitations.

This chapter includes the following topics:

- 10.1, “Command-line reference” on page 282
- 10.2, “Formats for IBM Spectrum Scale to IBM Spectrum Archive EE migration” on page 290
- 10.3, “System calls and IBM tools” on page 292
- 10.4, “IBM Spectrum Archive EE interoperability with IBM Spectrum Archive products” on page 295
10.1 Command-line reference

This section describes the IBM Spectrum Archive Enterprise Edition (IBM Spectrum Archive EE) commands, IBM Spectrum Scale commands, and Tivoli Storage Manager space management commands.

10.1.1 IBM Spectrum Archive EE help guide for commands

This section describes the syntax, parameters, and function of the IBM Spectrum Archive EE commands by way of the help guide. By following the help guide, any IBM Spectrum Archive EE command can be run by reviewing the description and syntax of the command syntax and using the provided examples.

The eeadm command

All IBM Spectrum Archive EE commands start with the `eeadm` command and all commands feature the following syntax:

```
  eeadm <resource type> <action> [OPTIONS]
  eeadm <subcommand> [OPTIONS]
```

The following resource types are available:

- `cluster`: Manages the IBM Spectrum Archive EE cluster
- `drive`: Manages the tape drives
- `file`: Manages the files on IBM Spectrum Scale
- `library`: Manages the tape libraries
- `node`: Manages the IBM Spectrum Archive EE servers
- `nodegroup`: Manages the node groups
- `pool`: Manages the tape storage pools
- `tape`: Manages the tape cartridges
- `task`: Manages the internal tasks

The following subcommands are available:

- `migrate`: Migrate files to the tapes and reclaim the disk space allocated to the file.
- `premigrate`: Migrate files to the tapes but do not reclaim the disk space.
- `recall`: Recall files from the tapes to the disk storage.
- `save`: Saves the name of empty files, empty directories, and symbolic links to the tapes.

The `eeadm` command is initially used to get the high-level view of all available resource types or subcommands that are available. Then, following the remaining help guide to find the desired command to run.

The `eeadm <resource type> --help command`

The `eeadm <resource type> --help` command displays the available list of actions for each resource type.

For example, the `eeadm cluster` command manages the IBM Spectrum Archive EE cluster.

To display the available actions for the eeadm cluster command, enter the following command:

```
eeadm cluster --help
```
In this case, the following actions for `eeadm cluster` are available:

- `eeadm cluster failover`
- `eeadm cluster set`
- `eeadm cluster show`
- `eeadm cluster start`
- `eeadm cluster stop`

Therefore, the `eeadm <resource type> --help` command should be the next help guide procedure that is used to find the available actions of each resource type.

**The `eeadm <resource type> <action> --help` command**

After the wanted action for the resource type is found, enter the `eeadm <resource type> <action> --help` command to display the overall syntax, description, required parameters, and optional parameters for the command. The output also includes command examples that can be used to run the wanted action.

Therefore, the `eeadm <resource type> <action> --help` command should be your final help guide procedures used to run the wanted commands.

### 10.1.2 Drive status and state codes

The `eeadm drive list` command lists all of the configured drives. Drives can be listed with one of the states listed in Table 10-1 or the drive state can be displayed as empty.

<table>
<thead>
<tr>
<th>Drive status</th>
<th>Drive state</th>
<th>Description and next action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>mounted</td>
<td>IBM Spectrum Archive EE can access this tape by using the file system interface, but no task is assigned to this drive, and a tape is in this drive. Next Action: None</td>
</tr>
<tr>
<td>ok</td>
<td>standby</td>
<td>IBM Spectrum Archive EE cannot access a tape by using the file system interface, but the tape is in this drive. No task is assigned to this drive. Next Action: None</td>
</tr>
<tr>
<td>ok</td>
<td>mounting</td>
<td>IBM Spectrum Archive EE is opening a file system interface to access a tape on this drive because of an assigned task. Next Action: None</td>
</tr>
<tr>
<td>ok</td>
<td>in_use</td>
<td>IBM Spectrum Archive EE is using this drive for a task. Next Action: None</td>
</tr>
<tr>
<td>ok</td>
<td>not_mounted</td>
<td>This drive does not include a tape. Next Action: None</td>
</tr>
<tr>
<td>ok</td>
<td>unmounting</td>
<td>IBM Spectrum Archive EE is closing a file system interface access to the tape in this drive because of opening a file system access to another tape, or moving a tape to the homeslot. Next Action: None</td>
</tr>
</tbody>
</table>
The `eedm file state` command displays the data placement of files. Each file is in a unique state, as listed in Table 10-2.

### Table 10-2 Status codes for the `eedm file state` command

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resident</td>
<td>The resident status indicates that the file is resident in the GPFS namespace and is not saved, migrated, or premigrated to a tape.</td>
</tr>
<tr>
<td>migrated</td>
<td>The migrated status indicates that the file was migrated. The file was copied from GPFS file system to a tape, and exists only as a stub file in the GPFS namespace.</td>
</tr>
<tr>
<td>premigrated</td>
<td>The premigrated status indicates that the file was premigrated. The file was copied to a tape (or tapes), but the file was not removed from the GPFS namespace.</td>
</tr>
</tbody>
</table>
### 10.1.3 Node status codes

The `eadm node list` command lists the configuration and status of all the configured nodes, as listed in Table 10-3.

**Table 10-3 Status codes for the eadm node list command**

<table>
<thead>
<tr>
<th>Status code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>saved</td>
<td>The <code>saved</code> status indicates that the file system object that has no data (a symbolic link, an empty directory, or an empty regular file) was saved. The file system object was copied from GPFS file system to a tape.</td>
</tr>
<tr>
<td>offline</td>
<td>The <code>offline</code> status indicates that the file was saved or migrated to a tape cartridge and thereafter the tape cartridge was exported offline.</td>
</tr>
<tr>
<td>missing</td>
<td>The <code>missing</code> status indicates that a file has the migrated or premigrated status, but it is not accessible from IBM Spectrum Archive EE because the tape cartridge it is supposed to be on is not accessible. The file might be missing because of tape corruption or if the tape cartridge was removed from the system without exporting.</td>
</tr>
</tbody>
</table>

### 10.1.4 Tape status codes

The `eadm tape list` command lists the configuration and status of all of the tapes, as listed in Table 10-4.

**Table 10-4 Tape status along with a description**

<table>
<thead>
<tr>
<th>New Status</th>
<th>Old Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>appendable</td>
<td>Valid</td>
<td>Tape is available and data can be appended.</td>
</tr>
<tr>
<td>append_fenced</td>
<td>Valid</td>
<td>Pool setting caused this tape to be fenced from appending data.</td>
</tr>
<tr>
<td>check_hba</td>
<td>N/A</td>
<td>Temporary flag because of HBA-related error on mount, unmount, load, or unload of the tape to or from the tape drive.</td>
</tr>
<tr>
<td>New Status</td>
<td>Old Status</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------</td>
<td>------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>check_key_server</td>
<td>N/A</td>
<td>Temporary flag because of encryption-related error on mount, unmount, load, or unload of the tape to or from the tape drive.</td>
</tr>
<tr>
<td>check_tape_library</td>
<td>Unusable</td>
<td>Temporary flag because of failed mount, unmount, load, or unload of the tape to or from the tape drive.</td>
</tr>
<tr>
<td>data_full</td>
<td>Valid</td>
<td>The tape is almost full (only metadata changes are accepted).</td>
</tr>
<tr>
<td>disconnected</td>
<td>Disconnect</td>
<td>The LTFS LE instance that has this tape is not running.</td>
</tr>
<tr>
<td>duplicated</td>
<td>Duplicate</td>
<td>Two or more tapes have the same barcode label in the logical library.</td>
</tr>
<tr>
<td>exported</td>
<td>Exported</td>
<td>The tape was exported by a normal export.</td>
</tr>
<tr>
<td>full</td>
<td>Valid</td>
<td>The tape is full and no other changes or updates can be made.</td>
</tr>
<tr>
<td>inaccessible</td>
<td>Inaccessible</td>
<td>The tape library reported that the tape is inaccessible.</td>
</tr>
<tr>
<td>label_mismatch</td>
<td>N/A</td>
<td>The barcode and label data on tape are mismatched.</td>
</tr>
<tr>
<td>missing</td>
<td>Missing</td>
<td>The tape is missing from the logical library.</td>
</tr>
<tr>
<td>need_replace</td>
<td>Warning</td>
<td>An read error occurred on the tape.</td>
</tr>
<tr>
<td>non_supported</td>
<td>Not supported</td>
<td>The tape is an unsupported media cartridge and should be removed from the logical library.</td>
</tr>
<tr>
<td>offline</td>
<td>Offline</td>
<td>The tape was exported offline.</td>
</tr>
<tr>
<td>recall_only</td>
<td>Write Protected</td>
<td>The tape is physically write-protected or write-protected by an advisory lock.</td>
</tr>
<tr>
<td>require_replace</td>
<td>Critical or Error or Write Fenced</td>
<td>The tape is in a read-only state because of a write error.</td>
</tr>
<tr>
<td>require_validate</td>
<td>Invalid</td>
<td>The tape is invalid from an LTFS LE perspective.</td>
</tr>
<tr>
<td>require_validate</td>
<td>Unknown</td>
<td>The tape status is unknown and a tape validation is needed.</td>
</tr>
<tr>
<td>unassigned</td>
<td>Unavailable</td>
<td>The tape is not assigned to any pool.</td>
</tr>
<tr>
<td>unformatted</td>
<td>Unformatted</td>
<td>The tape is in a pool, but is not LTFS-formatted.</td>
</tr>
</tbody>
</table>
Table 10-5 lists the next available commands for each tape status.

### Table 10-5  Next available actions for each tape status

<table>

**Require_validate state**

A tape cartridge in the state is a temporary condition that can be caused when the tape within the pool becomes unknown to the system, or the meta data on the gpfs file system becomes inconsistent with the data cartridge.

**Recall_only state**

This status is caused by setting the write-protection tag on the tape cartridge. If you want to use this tape cartridge in IBM Spectrum Archive EE, you must remove the write protection because a write-protected tape cartridge cannot be added to a tape cartridge pool. After the write-protection is removed, you must run the `eeadm tape validate` command to update the status of the tape to appendable.
**Require_replace state**
This status is caused by physical errors on the tape. The tape becomes a read-only tape and must be replaced as soon as possible. For more information about recovery procedures, see 9.3, “Recovering data from a write failure tape” on page 267 and 9.4, “Recovering data from a read failure tape” on page 268.

**Need_replace state**
This status is caused when a tape drive is encounters an error trying to read data off the tape. This tape also must be replaced as soon as possible to mitigate future failures. For more information about recovery procedures, see “Recovering data from a read failure tape” on page 268.

**Unassigned state**
This status is caused by a tape cartridge being removed from LTFS. The process of adding it to LTFS (see 6.8.1, “Adding tape cartridges” on page 132) changes the status back to appendable. Therefore, this message requires no other corrective action.

**Unformatted status**
This status usually is observed when a scratch tape is added to LTFS without formatting it. It can be fixed by removing and reading it with the eeadm tape assign command, as described in 6.8.3, “Formatting tape cartridges” on page 136.

If the tape cartridge was imported from another system, the IBM LTFS Format Verifier can be useful for checking the tape format. For more information about performing diagnostic tests with the IBM LTFS Format Verifier, see 10.3.2, “Using the IBM LTFS Format Verifier” on page 293.

**Inaccessible status**
This status is most often the result of a stuck tape cartridge. Removing the stuck tape cartridge and then moving it back to its homeslot (as described in 6.8.2, “Moving tape cartridges” on page 135) should correct the Inaccessible status.

**Not-supported status**
Only LTO-8, M8, 7, 6, 5, and 3592-JB, JC, JD, JE, JK, JL, JM, JV, JY, and JZ tape cartridges are supported by IBM Spectrum Archive EE. This message indicates that the tape cartridge is not one of these types and must be removed from the tape library.

### 10.1.5 IBM Spectrum Scale commands

Use these commands to manage GPFS file systems that you use with your IBM Spectrum Archive EE system.

**The mmapplypolicy command**
To manage migration and replication of the data to and from IBM Spectrum Scale storage pools, run the GPFS mmapplypolicy command. It can also be used to delete files from IBM Spectrum Scale.

The node on which the command is run must have the GPFS mounted. The node must be able to run remote shell commands on any other node in the IBM Spectrum Scale cluster without the use of a password and without producing any extraneous messages.
For more information, see “Requirements for administering a GPFS file system” in GPFS: Administration and Programming Reference, SA23-2221. GPFS documentation is available at IBM Knowledge Center:
- IBM Spectrum Scale
- GPFS

For more information about the `mmapplypolicy` command and GPFS or IBM Spectrum Scale, see your GPFS or IBM Spectrum Scale documentation.

The `mmgetstate` command
To display the state of the IBM Spectrum Scale daemon on one or more nodes, run the GPFS `mmgetstate` command.

The node on which the command is run must have the GPFS mounted. The node must be able to run remote shell commands on any other node in the IBM Spectrum Scale cluster without the use of a password and without producing any extraneous messages. For more information, see “Requirements for administering a GPFS file system” in GPFS: Administration and Programming Reference, SA23-2221, and the websites that are referenced in “The mmapplypolicy command” on page 288.

The GPFS `mmgetstate -a` command displays the nodes where GPFS is active.

10.1.6 Tivoli Storage Manager for Space Management commands

There is a subset of Tivoli Storage Manager for Space Management commands that you can use to configure and administer space management for the file systems that are used with your IBM Spectrum Archive EE system.

IBM Spectrum Archive EE provides a limited description of the commands in this subset. For more information about these commands, see the “HSM client command reference” topic and other related topics in “IBM Spectrum Protect for Space Management options, commands, and scripts” at IBM Knowledge Center.

Important: The IBM Spectrum Archive EE license does not entitle customers to use any other Tivoli Storage Manager components or products other than Tivoli Storage Manager for Space Management from the IBM Spectrum Protect family to migrate data to LTFS.

Compatibility of Tivoli Storage Manager for Space Management commands with IBM Spectrum Archive EE

Only a subset of Tivoli Storage Manager for Space Management commands is compatible with the IBM Spectrum Archive EE environment. Use only compatible Tivoli Storage Manager for Space Management commands. Otherwise, your system might not work correctly and error messages such as the following message might be returned:

ANS2172E Command not supported in HSMBACKENDMODE TSMFREE

The following Tivoli Storage Manager for Space Management commands are compatible with the IBM Spectrum Archive EE environment:

- `dsmmigfs`
- `dsmls`
- `dsmrecall`
The **dsmmigfs start, stop, and enablefailover functions**

To start or stop HSM daemons, run the **dsmmigfs** command with the **start** or **stop** parameter.

**Important:** The daemons are started with the same environment as the **dsmwatchd** watch daemon. Therefore, the **dsm.opt** and **dsm.sys** options files in the Tivoli Storage Manager for Space Management default installation path **/usr/tivoli/tsm/client/ba/bin** are used.

Before you use this command, complete the following steps to verify your IBM Spectrum Scale settings:

1. Verify that the IBM Spectrum Scale is active.
2. Verify that the node that you want to run the command from belongs to the IBM Spectrum Archive EE cluster, and has the file system mounted.

**Important:** To display the nodes where IBM Spectrum Scale is active, run the IBM Spectrum Scale **mmgetstate -a** command. For more information, see 6.2.1, “IBM Spectrum Scale” on page 116.

The **dsmmigfs** command includes the following parameters:

- **start**
  
  Starts all HSM daemons on the local client node, except for the watch daemon (**dsmwatchd**).

- **stop**
  
  Stops all space management daemons on the local client node, except for the watch daemon (**dsmwatchd**).

- **enablefailover**
  
  Activates the node for failover operations within the IBM Spectrum Scale cluster.

**dsmrecall**

To selectively recall migrated files to the local file system, run the **dsmrecall** command. Space management must be active.

The duration of the recall process depends on the size of the files that are being recalled. It takes time to mount and spool the LTFS tape cartridge, and the data transfer time for a large file can be considerable.

This command includes the **dsmrecall gpfs_path** syntax, as shown in the following example:

```
dsmrecall /ibm/ltfs/filename1.txt
```

### 10.2 Formats for IBM Spectrum Scale to IBM Spectrum Archive EE migration

This section describes the data and metadata formats that IBM Spectrum Archive EE uses for migrating files from an IBM Spectrum Scale / GPFS environment to an IBM Spectrum Archive (LTFS EE) system.
IBM Spectrum Archive EE uses the following data and metadata formats for migrating files from GPFS to LTFS:

- **GPFS data**
  Figure 10-1 shows an example of original GPFS data.

```plaintext
/gpfs (gpfs root directory)
  + file1
  + file2
  + dir1
    + file3
    + file4
    + dir2
      + file5
      + file6
```

*Figure 10-1  Example GPFS data directory structure*

- **Migrated data and symbolic links in LTFS**
  Figure 10-2 shows the LTFS data format of tapeA and tapeB after the following migrations of the GPFS files from Figure 10-1:
  - file1, file2, and file3 to tapeA.
  - file1 (which is a replica), file4, file5, and file6 to tapeB.

```plaintext
/LTFS (tape root directory)
  + tapeA/gpfs
    + file1 (symlink)  + CLID-FSID-IGEN1-INO1
    + file2 (symlink)  + CLID-FSID-IGEN2-INO2
    + dir1
      + file3 (symlink)  + CLID-FSID-IGEN3-INO3
  + tapeB/gpfs
    + file1 (symlink)  + CLID-FSID-IGEN1-INO1
    + dir1
      + file4 (symlink)  + CLID-FSID-IGEN4-INO4
      + dir2
        + file5 (symlink)  + CLID-FSID-IGEN5-INO5
        + file6 (symlink)  + CLID-FSID-IGEN6-INO6
```

*Figure 10-2  Example layout of migrated data and symbolic links on LTFS (on tapes)*

- **Migrated data**
  Migrated data is saved as files under the .LTFSEE_DATA directory on each tape. The LTFSEE_DATA directory is placed directly under the tape root directory on each tape. These data files are stored under unique ID (UID) based file names. A UID-based file name consists of the cluster ID (CLID), file system ID (FSID), inode generation number (IGEN), and inode number (INO). In this example, all of the files have the same CLID and the same FSID because all of the files belong to the same GPFS file system.
Symbolic links

The GPFS directory structure is rebuilt on each tape under the tape root directory for all the migrated files that the tape contains. For each data file, a symbolic link is created under the original GPFS file name and location, which points to the corresponding data file on the tape. When a symbolic link is created, a relative path to the target is used so that if the IBM Spectrum Archive mount point changes, the link stays correct. For the file1 example in Figure 10-2, the following symbolic link that corresponds to file1 is created on tapeA:

/ltfs/tapeA/gpfs/file1 → ../.LTFSEE_DATA/CLID-FSID-IGEN1-INO1

GPFS path as metadata in IBM Spectrum Archive

For each data file in IBM Spectrum Archive, an extended attribute is set that contains the original GPFS file path. In the file1 example in Figure 10-2, the two following LTFS files have the extended attribute gpfs.path set to the value (file1 GPFS path) /gpfs/file1:

- /ltfs/tapeA/.LTFSEE_DATA/CLID-FSID-IGEN1-INO1
- /ltfs/tapeB/.LTFSEE_DATA/CLID-FSID-IGEN1-INO1

The saved GPFS path gives you the ability to re-create the original IBM Spectrum Scale namespace by using the reconciliation and export processes followed by the import process. In case of disaster, the approximate IBM Spectrum Scale namespace can be recovered from tapes because without reconciliation, not all file deletions and renames in IBM Spectrum Scale are reflected on the migration target tapes. The saved path is also used for removing stale symbolic links when a file is recalled into resident state.

10.3 System calls and IBM tools

This section describes downloading the IBM Tape Diagnostic Tool (ITDT) and using the IBM Linear Tape File System Format Verifier (LFV).

10.3.1 Downloading the IBM Tape Diagnostic Tool

The ITDT is an independent tool that provides diagnostic tests on tape drives and libraries. This section describes how to download ITDT and access the related documentation.

Before you begin

IBM maintains the latest levels of the ITDT and related documentation on Fix Central. Information about using the ITDT is available in IBM Tape Device Drivers Installation and User's Guide, S7002972, which is available on the same website.

About this task

To access the Fix Central portal and download the most recent version of the ITDT, complete the following steps:

1. Open the following URL in your web browser:
   http://www.ibm.com/support/fixcentral
2. Click Product Group → System Storage.
3. Click Product Family → Tape systems.
4. Click Product Type → Tape drivers and software.
5. Click Product → IBM Tape Diagnostic Tool ITDT.
6. Select your operating system from the Platform menu.
7. Click Continue.
8. (Optional) Narrow the search of available downloads according to your criteria.
9. Click Continue to view the list of available downloads.
10. Select the version that you want to download.
11. To download the new version, follow the instructions on the Fix Central download page.

10.3.2 Using the IBM LTFS Format Verifier

This section describes how to download, install, and run the IBM LFV utility command (lfv) to verify media hardware and data compatibility.

**Before you begin**
Before installing the LTFS LFV, download the most recent version from the Fix Central website.

To download the most recent version of the LTFS LFV, complete the following steps:
1. Open the following URL in your web browser:
   http://www.ibm.com/support/fixcentral
2. Click Product Group → System Storage.
3. Click Product Family → Tape systems.
4. Click Product Type → Tape drivers and software.
5. Click Product → Linear Tape File System (LTFS) Format Verifier.
6. Select your operating system from the Platform menu.
7. Click Continue.
8. Narrow the search of available downloads according to your criteria (this step can be skipped).
9. Click Continue to view the list of available downloads.
10. Select the version that you want to download.
11. To download the new version, follow the instructions on the Fix Central download page.

**Latest levels:** IBM maintains the latest levels of the LTFS LFV and information about using the tool and related documentation on the IBM Fix Central website.

**About this task**
To install the LTFS LFV, complete the following steps:
1. Download lfvinst_<version>linuxx86_64 from this website:
   http://www.ibm.com/support/fixcentral
2. To make lfvinst_<version><OS><arch> an executable file, run the following command:
   chmod 700 lfvinst_<version><OS><arch>
3. To complete the installation, run the following command:
   fvinst_<version><OS><arch>
Verifying media compatibility by using the IBM LTFS Format Verifier

This section describes how to verify media hardware and data compatibility by using the LTFS LFV utility command. This section also describes the options that can be used with this command.

**Important:** LTFS LFV is not shipped with IBM Spectrum Archive EE, but is available as a separate download.

To verify that media are compatible with LTFS, run `lfv` from the command line. Enter one of the following commands:

- For Linux systems where the IBM Tape Device Driver is installed, `<target device>` should be `/dev/IBMtapeX`, where `X` is the index of the tape device to use, as shown in the following example:
  ```
  ./lfv -f /dev/IBMtape1
  ```
- For Linux systems where no IBM Tape Device driver is installed, `<target device>` should be `/dev/sgX`, where `X` is the index for the tape device to use, as shown in the following example:
  ```
  ./lfv -f /dev/sg0
  ```

**Important:** The index for the target tape device in the previous examples is shown as 0. If you are unsure which index value to use, run the `./lfv -s` command to scan for all attached tape devices.

The following `lfv` command options are available:

- `-f <target device>`
  The target tape device on which verification is performed.
- `-h`
  Displays help information.
- `-l`
  Specifies the log file name. The default name is `lfv.log`.
- `-ll [Errors|Warnings|Information|Debug]`
  Specifies the log level and the level of logging created. `Errors` is the default value.
- `-lp`
  Specifies the log output directory. The default directory is `./output`.
- `-s`
  Scans the system for tape devices and prints results to the window. This option provides a list of the available devices and can help you identify which drive to use. This option provides the following information:
  - Sequential number.
  - Driver handle/device file name.
  - Drive product name.
  - Drive firmware revision.
  - Drive serial number (S/N).
  - Host (H), bus (B), Target ID (T), and LUN (L) physical address of the drive.
For example, information that is provided by this list appears as shown in the following example:

```
#0 /dev/IBMtape0 -[ULT3580-TD4]-[85V1] S/N:1300000388 H2-B0-T0-L0
#1 /dev/IBMtape1 -[ULT3580-HH5]-[A2SG] S/N:1068000051 H2-B0-T1-L0
```

- **-v**
  Enables verbose verification information.

- **-V --version**
  Displays the program version.

- **-x**
  Specifies that the extended verification is performed. The extended verification analyzes the entire tape cartridge and can take up to three hours to complete. Quick verification is the default.

### 10.4 IBM Spectrum Archive EE interoperability with IBM Spectrum Archive products

IBM Spectrum Archive EE cannot run concurrently with IBM Spectrum Archive LE. If IBM Spectrum Archive LE is already installed, it must be uninstalled before IBM Spectrum Archive EE is installed. For more information about the uninstallation procedure, see the “Uninstalling LTFS from a Linux system” topic in IBM Knowledge Center.

In addition to uninstalling the IBM Spectrum Archive LE package, it is necessary to uninstall the IBM Spectrum Archive LE license module. To uninstall the license, you must run the following command after the other uninstallation commands that are presented in the IBM Spectrum Archive LE IBM Knowledge Center:

```
# rpm -e ltfs-license-2.1.0-[revision]
```
Related publications

The publications that are listed in this section are considered suitable for a more detailed description of the topics that are covered in this book.

IBM Redbooks

The following IBM Redbooks publications provide more information about the topics in this document. Some publications that are referenced in this list might be available in softcopy only:
